

M.TECH. -THERMAL SCIENCES AND ENERGY SYSTEMS

Department of Mechanical Engineering

India is energy starved country and per capita consumption of energy in India is one of the lowest in the world. India faces a formidable challenge in providing adequate and efficient energy supplies to users at a reasonable cost. It will be a great challenge to meet the energy demand, and producing it efficiently without polluting the environment. This programme is designed to enable the students to develop expertise in both theory and design of Thermal Systems, Energy Systems and Energy Management. They also acquire knowledge to design and develop micro/nano scale thermal systems. The students learn to simulate various fluid, thermal and energy systems using different computational tools and also do experiments to test various thermal and energy systems.

This programme offers many career options for the youngsters in both public and private sector involved in production of energy, design and production of thermal systems and energy systems. They will also get opportunities to join various Research and Development organizations.

CURRICULUM

First Semester

Course Code	Type	Course	LTP	Cr
16MA620	FC	Computational Methods in Fluid Flow and Heat Transfer	3 0 1	4
16TE601	FC	Applied Heat Transfer	310	4
16TE602	FC	Advance Fluid Mechanics	310	4
16TE603	FC	Thermal Power Plant Cycles and Systems	300	3
16TE621	SC	Renewable Energy Systems	300	3
16TE625	SC	Energy Conversion Lab	00 1	1
16HU601	HU	Cultural Education*		P/F
			Credits	19

*Non Credit Course

Second Semester

Course Code	Type	Course	LTP	Cr
16TE622	SC	Design and Optimization of Thermal Systems	300	3
16TE623	SC	Gas Turbines and Jet Propulsion	300	3
16TE624	SC	Computational Fluid Dynamics	300	3
	E	Elective I	300	3
	E	Elective II	300	3
16TE626	SC	Thermal Science Lab	00 1	1
16TE627	SC	Computational Lab	00 1	1
16TE628	SC	Seminar	0 01	1
16EN600	HU	Technical Writing*		P/F
Credits				18

*Non Credit Course

Third Semester

Course Code	Type	Course	LTP	Cr
	E	Elective III	300	3
	E	Elective IV	300	3
16TE798	P	Dissertation		8
Credits				14

Fourth Semester

Course Code	Type	Course	LTP	Cr
16TE799	P	Dissertation		14
Credits				14

Total Credits 65

LIST OF COURSES

Foundation Core

Course Code	Course	L T P	Cr
16MA620	Computational Methods in Fluid Flow and Heat Transfer	3 0 1	4
16TE601	Applied Heat Transfer	3 1 0	4
16TE602	Advance Fluid Mechanics	3 1 0	4
16TE603	Thermal Power Plant Cycles and Systems	3 0 0	3

Subject Core

Course Code	Course	L T P	Cr
16TE621	Renewable Energy Systems	3 0 0	3
16TE622	Design and Optimization of Thermal Systems	3 0 0	3
16TE623	Gas Turbines and Jet Propulsion	3 0 0	3
16TE624	Computational Fluid Dynamics	3 0 0	3
16TE625	Energy Conversion Lab	0 0 1	1
16TE626	Thermal Science Lab	00 1	1
16TE627	Computational Lab	00 1	1
16TE628	Seminar	0 0 1	1

LIST OF ELECTIVES

Course Code	Course	LTP	Cr
16TE701	Design of Heat Exchangers	300	3
16TE702	Multiphase Flow	300	3
16TE703	Fluidized Bed Systems	300	3
16TE704	Nano /Micro Heat Transfer	300	3

16TE705	Microscale Thermal Sciences	300	3
16TE706	Measurements in Thermal Systems	300	3
16TE707	Emerging Refrigeration Technologies	300	3
16TE708	Solar Energy	300	3
16TE709	Energy Modeling, Economics and Project Management	300	3
16TE710	Energy and Environment	300	3
16TE711	Compressible Flow	300	3
16TE712	IC Engine Combustion and Pollution	300	3
16TE713	Fuel Technology	300	3
16TE714	Micro Channel Flow and Mixing Analysis	300	3
16TE715	Energy Management	300	3
16TE716	Energy Policies for Sustainable Development	300	3

Project Work

Course Type	Course	LTP	Cr
16TE798	Dissertation		8
16TE799	Dissertation		14

Review of errors: Accuracy and Precision, round-off error and truncation error. Roots of Transcendental and Polynomial Equations, System of nonlinear equations, Review of Matrix Algebra: Systems of Equations, Eigenvalues and Eigen vectors, Iteration Methods, Interpolation and Approximation, Finite difference operators, interpolating polynomials using finite differences, Ordinary Differential Equations, Solutions of Ordinary Differential Equations: Initial value problems and Boundary Value Problems, Second, Third and Fourth order Runge Kutta Methods. Partial differential equations – classification, hyperbolic, parabolic and elliptic PDEs, discretization errors, stability and consistency. Introduction to use of irregular meshes. Applications of numerical methods to equations of Fluid Mechanics and Heat transfer-Wave equation, Heat equation, Laplace equation and Burgers' equation.

1. *Steven Chapra and Raymond Canale – 'Numerical Methods for Engineers', Sixth Edition, McGraw Hill – 2009.*
2. *Rizwan Butt - 'Introduction to Numerical Analysis Using MATLAB' - Jones and Bartlett Publisher – 2010.*
3. *Abdelwahab Kharab, Ronald B. – 'An Introduction to Numerical Methods: A MATLAB Approach', Third Edition, CRC Press, 2012.*
4. *Anderson, D. A, Tannehill, J. C. and R. H. Pletcher, "Computational Fluid Mechanics and Heat Transfer", Second Edition, Taylor & Francis, 1995.*
5. *Muraleedhar, K. and T. Sundararaja, T. (eds.), "Computational Fluid Flow and Heat Transfer", Second Edition, Narosa Publishing House, 2003.*

Conduction: Steady state conduction. Extended surfaces of different types- Analysis of heat conduction in 2-D fins, 2-D and 3-D conduction in solids. Analysis of transient heat conduction with complex boundaries. Numerical methods in solving conduction problems with different boundary conditions.

Convection: Conservation equations. Thermal boundary layer. Forced convection – Practical correlations –flow over surfaces – internal flow. Natural convection, combined forced and free convection combined convection and radiation in flows. Boiling and Condensation: Boiling – Pool and flow boiling, correlations. Condensation – modes and mechanisms – correlations and problems. Heat Exchangers: Heat Exchanger and Mass Transfer -Heat exchanger: types – LMTD method and the effectiveness – NTU method. Heat pipes, compact heat exchangers.

Radiation: Recapitulation of fundamentals of radiative heat transfer. Radiant energy transfer through absorbing, emitting and scattering media. Combined conduction and radiation systems.

16TE603

THERMAL POWER PLANT CYCLES AND SYSTEMS

3-0-0-3

Energy sources - Fossil fuels, Nuclear fuels, Solar and Conventional energy sources - Fuel storage, Preparation, Handling and Combustion - Combustion calculations - General layout of Conventional Thermal power plants - Design and Operation- Superheat, Reheat and Regeneration - Other auxiliaries of thermal power plant – High pressure boilers -Steam Generators control. Steam nozzles and Steam turbines - Working - Compounding - Governing of steam turbines - Condensers and Cooling towers - Cycles for Steam power plants - Rankine cycle and its analysis - Reheat cycle, Regenerative cycle and Binary power cycle - Steam piping - Waste heat management. Diesel electric power plant - working and fields of use - Different systems of diesel electric power plants and plant layout - Gas turbine and combined cycle analysis – Inter-cooling, reheating and regeneration - design for high temperature - Combined cycles with heat recovery boiler – Combined cycles with multi-pressure steam - STAG combined cycle power plant - Influence of component efficiencies on cycle performance. Nuclear power plants – Introduction - Nuclear fuels - Atomic number and mass number - Atomic mass unit - Nuclear energy conversion - Chemical and nuclear equations - Nuclear reactions -Fission and fusion – Energy from fission and fuel burn-up - Radioactivity - Neutron energies - Fission reactor types - Fast breeder reactor - Production of nuclear fuels -

16TE621

RENEWABLE ENERGY SYSTEMS

3-0-0-3

Introduction: Energy demand growth and supply: Historical Perspectives, Fossil fuels, Consumption and Reserve; Environmental Impacts of Burning of Fossil fuels. Sustainable development and role of renewable energy sources. Solar Energy: The Sun as energy source and its movement in the sky. Solar energy received on the earth; Primary and Secondary Solar energy and Utilization of Solar Energy. Solar concentrators and tracking; Dish and Parabolic trough concentrating generating systems, Central tower solar thermal power plants; Solar ponds. Photovoltaic cells. Wind Energy: Types of turbines, Coefficient of Power, Betz limit, Wind electric generators, Power curve; wind characteristics and site selection; Potential of wind electricity generation in India and its current growth rate. Biomass Energy: Biomass: Sources and Characteristics; Wet biogas plants; Biomass gasifiers: Classification and Operating characteristics; Updraft and Downdraft gasifiers; Gasifier based electricity generating systems. Ocean Energy: Tidal power plants: single basin and double basin plants, Variation in generation level; Ocean Thermal Electricity Conversion (OTEC); Power generation from Waves: Shoreline and Floating wave systems. Geothermal Energy: Conversion technologies- Steam and Binary systems; Geothermal power plants.

16TE625

ENERGY CONVERSION LAB

0-0-1-1

CI and SI engines test rigs, fluid machine test rigs, solar water heaters, biomass gasifier, waste heat recovery system, photovoltaic system, wind energy system, etc., wind tunnels, drag and lift measurements and verification using software.

16TE622

DESIGN AND OPTIMIZATION OF THERMAL SYSTEMS

3-0-0-3

Thermal systems-Basic characteristics, analysis, types and examples. Formulation of design problem-steps involved. Modeling of thermal systems-importance and types. Mathematical modeling, curve fitting, physical modeling and dimensional analysis. Numerical modeling and simulation. Acceptable design of a thermal system: Design strategies, design of systems from different application areas; Economic Considerations: calculation of interest, worth of money as a function of time, series of payments, raising capital, taxes, economic factor in design, application to thermal systems. Optimization-Problem formulation for optimization: Optimization methods, practical aspects in optimal design. optimization of constrained and unconstrained problems, search methods: single-variable problem, multivariable constrained optimization, examples of thermal systems; geometric, linear, and dynamic programming and other methods for optimization

16TE623

GAS TURBINES AND JET PROPULSION

3-0-0-3

Compressible Flow: One-dimensional flow, speed of sound, variable cross-section flow, converging diverging nozzle, flow with friction and heat transfer, normal and oblique shock waves. Fundamentals of turbo machines: ideal and actual cycles for shaft power and propulsion. Compressors: axial flow and centrifugal compressors, principle of operation, work done, elementary theory, performance, compressibility effects, surge and stall. Combustion Systems: types, requirements, combustion chamber performance, emissions. Axial and radial flow turbines: elementary theory, vortex theory, performance characteristics, blade cooling, design of gas turbines, off design performance, gas turbine blade materials. Thermodynamics of propulsion system, engine performance parameters. Air breathing and non-air breathing engines, aircraft gas turbine engine, cycle analysis of ideal and real engines. Turbojet, turboprop, turbofan engines, ramjet and pulsejet engines.

16TE624

COMPUTATIONAL FLUID DYNAMICS

3-0-0-3

A broad review in terms of historical background, application and purpose of study. Introduction to One- Dimensional Computation by FDM, FEM, FVM. Neumann boundary condition and Dirichlet boundary condition. Governing equation of Fluid Dynamics: Derivation, Discussion, Physical meaning and governing equation forms suitable for CFD. Turbulence and its modeling, Characteristics of simple turbulent flows, The effect of turbulent fluctuations on properties of the mean flow, Reynolds-averaged Navier–Stokes equations (RANS) and classical turbulence models- Mixing length model, $k-\epsilon$ model, Reynolds stress equation models, advanced turbulence models. Large eddy simulation (LES), Direct numerical simulation (DNS). Finite volume method for diffusion problems, convection-diffusion problems. Solution algorithms for pressure-velocity coupling in steady flows. The finite volume method for unsteady flows. Implementation of boundary conditions. Errors and uncertainty in CFD modeling. Finite Element Methods in CFD.

16TE626

THERMAL SCIENCE LAB

0-0-1-1

Heat transfer test rigs, nano and micro heat transfer test rigs, heat pipe systems, heat exchangers, refrigeration and air conditioning systems, fluidized bed system etc.

16TE627

COMPUTATIONAL LAB

0-0-1-1

Programming exercising for fluid flow and heat transfer using finite volume methods. Training on Commercial CFD Software.

16TE701

DESIGN OF HEAT EXCHANGERS

3-0-0-3

Introduction: Types, Classification of heat exchangers; Basic design methods for Recuperators and Regenerators: LMTD, effectiveness-NTU method; Forced convection correlations, pressure drop, fouling in heat exchangers; Double pipe heat exchangers: Thermal and Hydraulic design; Fundamentals of two phase heat transfer; Shell and Tube Heat exchangers: Basic design procedure, Kern method, Bell-Delaware method, stream analysis method; Heat exchanger Network (HEN) and process integration; Pinch design method; Design of Boilers, cooling towers, super heaters, Condensers; Compact Heat Exchangers; Process Fired heaters and furnaces; Thermodynamics of heat exchangers: Principles of Exergy analysis.

16TE702

MULTIPHASE FLOW

3-0-0-3

Introduction- multi phase and multi-component flow, practical examples; method of analysis of multi phase and multi-component flow problems; basic definitions; two phase, one-dimensional conservation equations; pressure gradient components; flow patterns, Two phase flow patterns in mini and micro-channels. Basic flow models – homogeneous flow model, pressure gradient, two phase friction factor for laminar flow and turbulent flow, two phase viscosity, friction multiplier; separated flow model – pressure gradient, Lokhart Martinelli correlation; Multidimensional two fluid model. Drift flux model – gravity dominated flow regime, corrections for void fraction and velocity distribution in different flow regimes, pressure loss due to multi phase flow in pipe fittings, velocity and concentration profiles in multi phase flow; one-dimensional waves in two component flow, void-quality correlations. Boiling and condensation – evaporation, nucleate boiling, convective boiling; bubble formation and limiting volume; boiling map; DNB; critical boiling conditions ; static and dynamic instabilities , condensation process – types of condensation, Nusselt theory, deviations from Nusselt theory, practical equations, condensation of flowing vapors; introduction to boiling and condensation in small passages.

16TE703

FLUIDIZED BED SYSTEMS

3-0-0-3

Introduction to fluidized bed technology - Regimes of fluidized behavior - Heat transfer in fluidized bed - Residence time distribution and size distribution in fluidized bed – Heat transfer to immersed surfaces in fluidized and packed beds. Theory of fluidized bed combustion (FBC) - System design for combustion and gasification - Fluidized bed combustion systems for power plants - Air distribution design - Combustion efficiency - Start up and shut down - Combustion of coal in fluidized beds – Desulfurization of coal in fluidized bed - Use of wood and agricultural waste for fluidized bed combustion. Mathematical modeling of fluidization process - Multiphase models - Fluidized bed gasification systems - Production of gaseous fuels form coal in fast fluidized beds -Chemically active fluidized bed gasifier - Conversion of gas in bubbling beds - Entrainment and elutriation. Fluidized bed heat exchangers - Fluidized bed furnaces and boilers - Fluidized bed steam generator for liquid metal fast breeder reactor - Pressurized fluidized bed combustion boilers - Pressurized adiabatic and pressurized air tube fluidized bed combustion.

16TE704

NANO /MICRO HEAT TRANSFER

3-0-0-3

Introduction, Overview of Macroscopic Thermal Sciences, Elements of Statistical Thermodynamics and Quantum Theory, Statistical Mechanics of Independent Particles, Thermodynamic relations, Basic Quantum Mechanics, Emission and Absorption of photons by Molecules or Atoms, Energy-Mass- Momentum in terms of Relativity,

Kinetic Theory and Micro/Nan fluidics, Kinetic Description of Dilute Gases, Transport Equations and properties of Ideal Gases, the Boltzmann Transport Equation, Micro-Nano fluidics Heat Transfer,

Thermal Properties of Solids and the size effect, Specific heat of Solids, Quantum size effect on the specific heat, Electrical and Thermal Conductivities of solids, Thermoelectricity, Classical size effect on conductivities and Quantum conductance

Electron and Phonon Transport, The Hall effect, General classification of solids, Crystal structures, Electronic Band structures, Phonon dispersion and scattering, Electron emission and tunnelling, Electrical transport in semiconductor devices,

Nonequilibrium Energy Transfer in Nanostructures, Phenomenological theories, Heat Conduction across layered structures, Heat conduction regimes.

Fundamentals of Thermal radiation, radiative properties of semi-infinite media, Dielectric function models. Radiative properties of Nanomaterials, Radiative properties of a single layer, Radiative properties of a multilayer structures, Photonic crystals, Periodic gratings, BRDF,

16TE705

MICROSCALE THERMAL SCIENCES

3-0-0-3

Introduction: Micro Electro-Mechanical Systems (MEMS), Micro channels, Heat pipes, Jets, Valves, Heat sinks, Solar cells, Bearings, Pumps, Flow sensors and actuators, Fins, Drug delivery systems; Transport Equations: Mass, Momentum, Heat and Charge transport equations, Multi-component systems, Characteristic Non-dimensional parameters; Micro-scale Heat Conduction: Micro-scale energy transport in solids, Heat transport in thin films and at solid-solid interfaces, Heat conduction in semiconductor devices and interconnects; Convective diffusion Phenomena: Enzyme-substrate reactions, External flow, Internal flow, Channel flow with soluble or rapidly reacting walls, Flow past reacting flat plate; Solutions of Electrolytes: Electric double layer of Debye sheath, Electro kinetic phenomena, Electro osmosis, Electro-osmotic micro channel systems, Electro-osmotic Pumps; Surface Tension Driven Flows: Coating flows, Thin capillary flows, Thermo capillary pump, Diffuso-capillary flows, Marangoni convection and instability; Modeling: Continuum model, Molecular model, Introduction to molecular dynamics simulations and direct simulation Monte Carlo method (DSMC); Assorted Journal Papers.

16TE706

MEASUREMENTS IN THERMAL SYSTEMS

3-0-0-3

Generalized configuration and functional description of measuring instruments, generalized performance characteristics of instruments - static characteristics, dynamic characteristics, and Uncertainty analysis. Data logging and acquisition, use of intelligent instrument for error reduction, elements of micro-computer interfacing, intelligent instruments in use. Measurement of thermo-physical properties, instruments for measuring temperature, pressure and flow, use of intelligent instruments for the physical variables. Chemical. Thermal, magnetic and optical gas analyzers, measurement of smoke, dust and moisture, gas chromatography, spectrometry. Shadowgraph, Schlieren, Interferometer, Laser-Doppler anemometer, heat flux measurement.

16TE707

EMERGING REFRIGERATION TECHNOLOGIES

3-0-0-3

Introduction to refrigeration systems, methods of conventional refrigeration, units of refrigeration, COP, Review of vapour compression refrigeration system, vapour absorption system. Introduction to nonconventional refrigeration technologies- Thermoelectric refrigeration, magnetic refrigeration, pulse tube refrigeration, acoustic refrigeration, steam jet refrigeration, vortex tube refrigeration. Thermoelectric refrigeration-principle, thermoelectric properties, Seebeck effect, Peltier effect, System description, performance analysis, Applications. Introduction to Magnetic refrigeration, magneto-caloric effect, magnetic materials, magnetic refrigeration near room temperature. Advantages over traditional refrigeration system, cryocoolers, pulse tube refrigerators. Principles and application of steam jet refrigeration system, performance analysis. Vortex tube refrigeration system, system description. Refrigerants, applications- Modern refrigerants - Need for alternative refrigerants – eco-friendly refrigerants - mixtures of refrigerants. Modifications required for retrofitting, safety precautions and compatibility of refrigerants with the materials.

16TE708

SOLAR ENERGY

3-0-0-3

Solar Radiation:- Availability, Solar radiation geometry, day length, angle of incidence on tilted surface - extraterrestrial characteristics - measurement and estimation on horizontal and tilted surfaces. Introduction to Solar Collectors (Liquid Flat - Plate Collector, Air Heater and Concentrating Collector) and Thermal Storage - Steady State Transient Analysis - Solar Pond - Solar Refrigeration. Principle of working, types - design and operation of - solar heating and cooling systems - solar water heaters – thermal storage systems – solar still – solar cooker – solar pond – solar drying. Photovoltaic solar cell - p-n junction: metal-semiconductor interface - dark and illumination characteristics - figure of merits of solar cell - efficiency limits - variation of efficiency, Types of Solar Cells - their Applications - Experimental Techniques to determine the Characteristics of Solar Cells, thermo-photovoltaics. Photovoltaic Hybrid Systems - Photovoltaic Thermal Systems- Storage Battery - Solar Array and their Characteristics Evaluation - Solar Chargeable Battery.

16TE709

**ENERGY MODELING, ECONOMICS
AND PROJECT MANAGEMENT**

3-0-0-3

Models and modeling approaches: input output analysis, energy demand analysis and forecasting, economics of standalone power supply systems, project management. macroeconomic Concepts- Measurement of National Output-Investment Planning and Pricing -Economics of Energy reserves and Cost Estimation. Multiplier Analysis, Energy and Environmental Input/Output Analysis, Overview of Econometric Methods, Energy Aggregation-Econometric Energy Demand Modeling. Energy Demand Analysis-Energy Technology Forecasting, Sectoral Energy Demand Forecasting. Solar Energy-Biomass Energy-Wind Energy and other Renewable Sources of Energy - Economics of Waste Heat Recovery and Cogeneration-Energy Conservation. Cost Analysis-Budgetary Control-Financial Management-Project Evaluation. Basic concept of econometrics and statistical analysis: 2-variable regression model; multiple regression model; Tests of regression coefficients and regression equation; Econometric techniques used for energy analysis and forecasting with case studies form India; Computerized Input – Output Analysis, Basic concept of Input-output analysis. Implications of energy multiplier for analysis of regional and national energy policy; Energy and environmental Input - Output analysis using I-O model. Energy Modeling: Interdependence of energy-economy-environment; Modeling concept, and application. Interfuel substitution models; SIMA model, and I-O model for energy policy analysis; Simulation and forecasting of future energy demand consistent with macroeconomic parameters in India; Energy Economics and Policies: National and Sectoral energy planning; Integrated resource planning; Energy pricing. Project Evaluation & Management: Financial analysis: Project cash flows, time value of money, life cycle approach & analysis, conception, definition, planning, feasibility and analysis; Project appraisal criteria; Risk analysis; Project planning matrix; Aims oriented project planning; Social cost benefit analysis. Network analysis for project management; Time estimation; Critical path determination; PERT, CPM and CERT; Fuzzy logic analysis; Stochastic based formulations; Project evaluation techniques; Funds planning; Project material management, evaluation & analysis; Implementation and monitoring; Performance indices.

ENERGY AND ENVIRONMENT

3-0-0-3

Energy Overview: Basics of energy - Types of energy and its utilization - Energy characteristics – Energy Measures- global energy scenario - India energy scenario- Types of energy and its utilization – Energy characteristics - Energy saving measures. Fundamentals of environment -

Water cycle - Oxygen cycle - Carbon cycle - Nitrogen cycle - Phosphorous cycle - Bio-diversity - Environmental aspects of energy utilization - Public health issues related to environmental Pollution. Air Pollution: Classification of air pollutants, sources of emission and air quality standards - Physical and chemical characteristics - Meteorological aspects of air pollutant dispersion - Temperature lapse rate and stability. Factors influencing dispersal of air pollutant - Air pollution dispersion models - Air pollution sampling and measurement, Ambient air sampling, Gaseous air pollutants, Particulate air pollutants, Analysis of air pollutants. Air Pollution Control methods. Types of controls – Particulate emission control – Gaseous emission control. Water pollution, Sources and classification of water pollutants, Waste water sampling and analysis, Basic process of waste water treatment - Primary treatment - Secondary treatment - Advanced treatment. Methods of feed water treatment. Environmental impact assessment: Air quality and water quality standards – Pollution prevention and control acts - Principles and methodology of Environmental impact assessment, Air and water quality impacts by project type.

COMPRESSIBLE FLOW

3-0-0-3

Conservation equations for inviscid flows, one dimensional flow – speed of sound, Mach number, normal shock relations, Hugoniot equation, one dimensional flow with friction and heat transfer, flow through variable area ducts, oblique shock waves and expansion waves, supersonic flow over wedges, cone, detached shock, regular reflection from solid boundary, intersection of shocks of same and opposite families, Prandtl-Meyer expansion waves, shock expansion theory. Unsteady wave motion – moving normal shock waves, reflected shock wave, incident and reflected expansion waves, shock tube relations. Linearised flow, critical Mach number. Transonic and Hypersonic flows, Properties of high temperature gases, high temperature flows – some basic examples.

IC ENGINE COMBUSTION AND POLLUTION

3-0-0-3

Thermochemistry of Fuel-air mixtures, Properties of working fluids, chemical kinetics, First law analysis, Availability analysis of engine processes. Conceptual SI engine combustion models, features of SI engine combustion processes Thermodynamic analysis of SI engine combustion, Flame structure and speed, abnormal combustion. Features of CI engine combustion process, conceptual CI engine combustion models, combustion process characterization. Fuel injection, spray structure, atomization, penetration, drop size distribution, spray evaporation. Ignition delay, factors affecting delay. Mixing controlled combustion, heat release rates , effect of engine design

variables, swirl, injection rates. Thermodynamic analysis of CI engine combustion. Supercharging of SI & CI engines and its limitations, methods of supercharging, supercharging arrangements , turbochargers , methods of turbo charging & its limitations. Air Pollution - Sources and nature of various types of pollutants, Pollutant formation, control, Pollution monitoring instruments and techniques. Modern developments in IC Engines, EGR, MPFI, HCCI, Gasoline Direct Injection. Alternative fuels to reduce emissions: Alcohols, natural gas, biodiesel, hydrogen.

FUEL TECHNOLOGY

3-0-0-3

Solid, liquid and gaseous fuels, Advantages and challenges. Coal as a source of energy and chemicals in India, Coal preparation, Carbonization, Gasification and liquefaction of coal and lignite, principle of combustion, Enthalpy of formation and combustion. Petroleum and its derived products, testing of liquid fuels, Petroleum refining processes, Separation and purification, Inter-conversion of fuels. Gaseous fuels, Natural gases and its derivatives, sources, potential challenges, Gas hydrates. Combustion appliances for solid, liquid and gaseous fuels. Alternative fuels, Introduction to nuclear fuel, RDF, Bio-fuels, etc.

MICRO CHANNEL FLOW AND MIXING ANALYSIS

3-0-0-3

Introduction – Physics at the micrometric scale – Miniaturization of systems – Hydrodynamics of micro-fluidic systems – Interface phenomena in micro-fluidics – Diphasic flows and emulsions in Microsystems. Electro hydrodynamics in microsystems – Electro-osmosis and electrophoresis in micro-channels – Effect of surface heterogeneity on electro-kinetic flow – Experimental studies of electro-osmotic flow – Electrophoretic motion of particles in micro-channels. Diffusion, mixing and separation in Microsystems – Advection–diffusion equation – Analysis of dispersion phenomena – Introduction to turbulence and chaos – Chaotic mixing and chaotic advection – Cascade models for turbulence and mixing analysis – Examples for mixing in Microsystems. Special topics in micro-fluidics – Thermalization of heat source in Microsystems - Evaporation and boiling in micro-channels – Micro-exchangers for electronic components – Micro-fabrication – Photolithography – Fabrication of glass and Plastic MEMS – Micro-fluidic structures – Micro-fabricated valves and pumps – Micro-fluidics for biomedical applications.

ENERGY MANAGEMENT

3-0-0-3

Energy sources and reserves, Basics of Energy and its various forms, Energy Management techniques, Energy Audit, Energy Action Planning, Financial Management, Project Management, Energy Monitoring and Targeting. Global Environmental Concerns, carbon foot print. Energy Efficiency in Thermal Utilities -Boilers-Steam System-Furnaces. Insulation and Refractory. FBC Boilers, Cogeneration techniques, Waste heat recovery. Energy Efficiency in Electrical Utilities-power factor-Electric Motors-Compressed Air System-HVAC and Refrigeration System-Fans, Blowers and Pumps, Energy rating. Cooling Towers. Lighting Systems. Diesel Generating System. Energy Performance Assessment for Equipment- Boilers-Furnaces- Cogeneration, Turbines (Gas, Steam), Heat Exchangers, Electric Motors and Variable Speed Drives. Financial Analysis-Applications of Non- Conventional Energy Sources-Waste Minimization and Resource Conservation. Material and Energy Balance

ENERGY POLICIES FOR SUSTAINABLE DEVELOPMENT

3-0-0-3

Energy Scenario, Energy policies of India - Supply focus approach and its limitations - Energy paradigms – DEFENDUS approach - End use orientation - Energy policies and development - Case studies on the effect of Central and State policies on the consumption and wastage of energy - Critical analysis - Need for renewable energy policies in India. Energy and environment - Green house effect - Global warming - Global scenario - Indian environmental degradation - Environmental laws - Water (prevention & control of pollution) act 1974 - The environmental protection act 1986 - Effluent standards and ambient air quality standards - Latest development in climate change policies & CDM. Energy conservation schemes - Statutory requirements of energy audit - Economic aspects of energy audit - Capital investments in energy saving equipment - Tax rebates - Advantages of 100% depreciation – India's plan for a domestic energy cap & trade scheme.

Social cost benefit analysis - Computation of IRR and ERR - Advance models in energy planning – Dynamic programming models in integrated energy planning - Energy planning case studies -

Development of energy management systems - Decision support systems for energy planning and energy policy simulation.
