

CSE102

Computer Programming

I've got the answer you need; it's right here in the Encyclopedia Britannica.

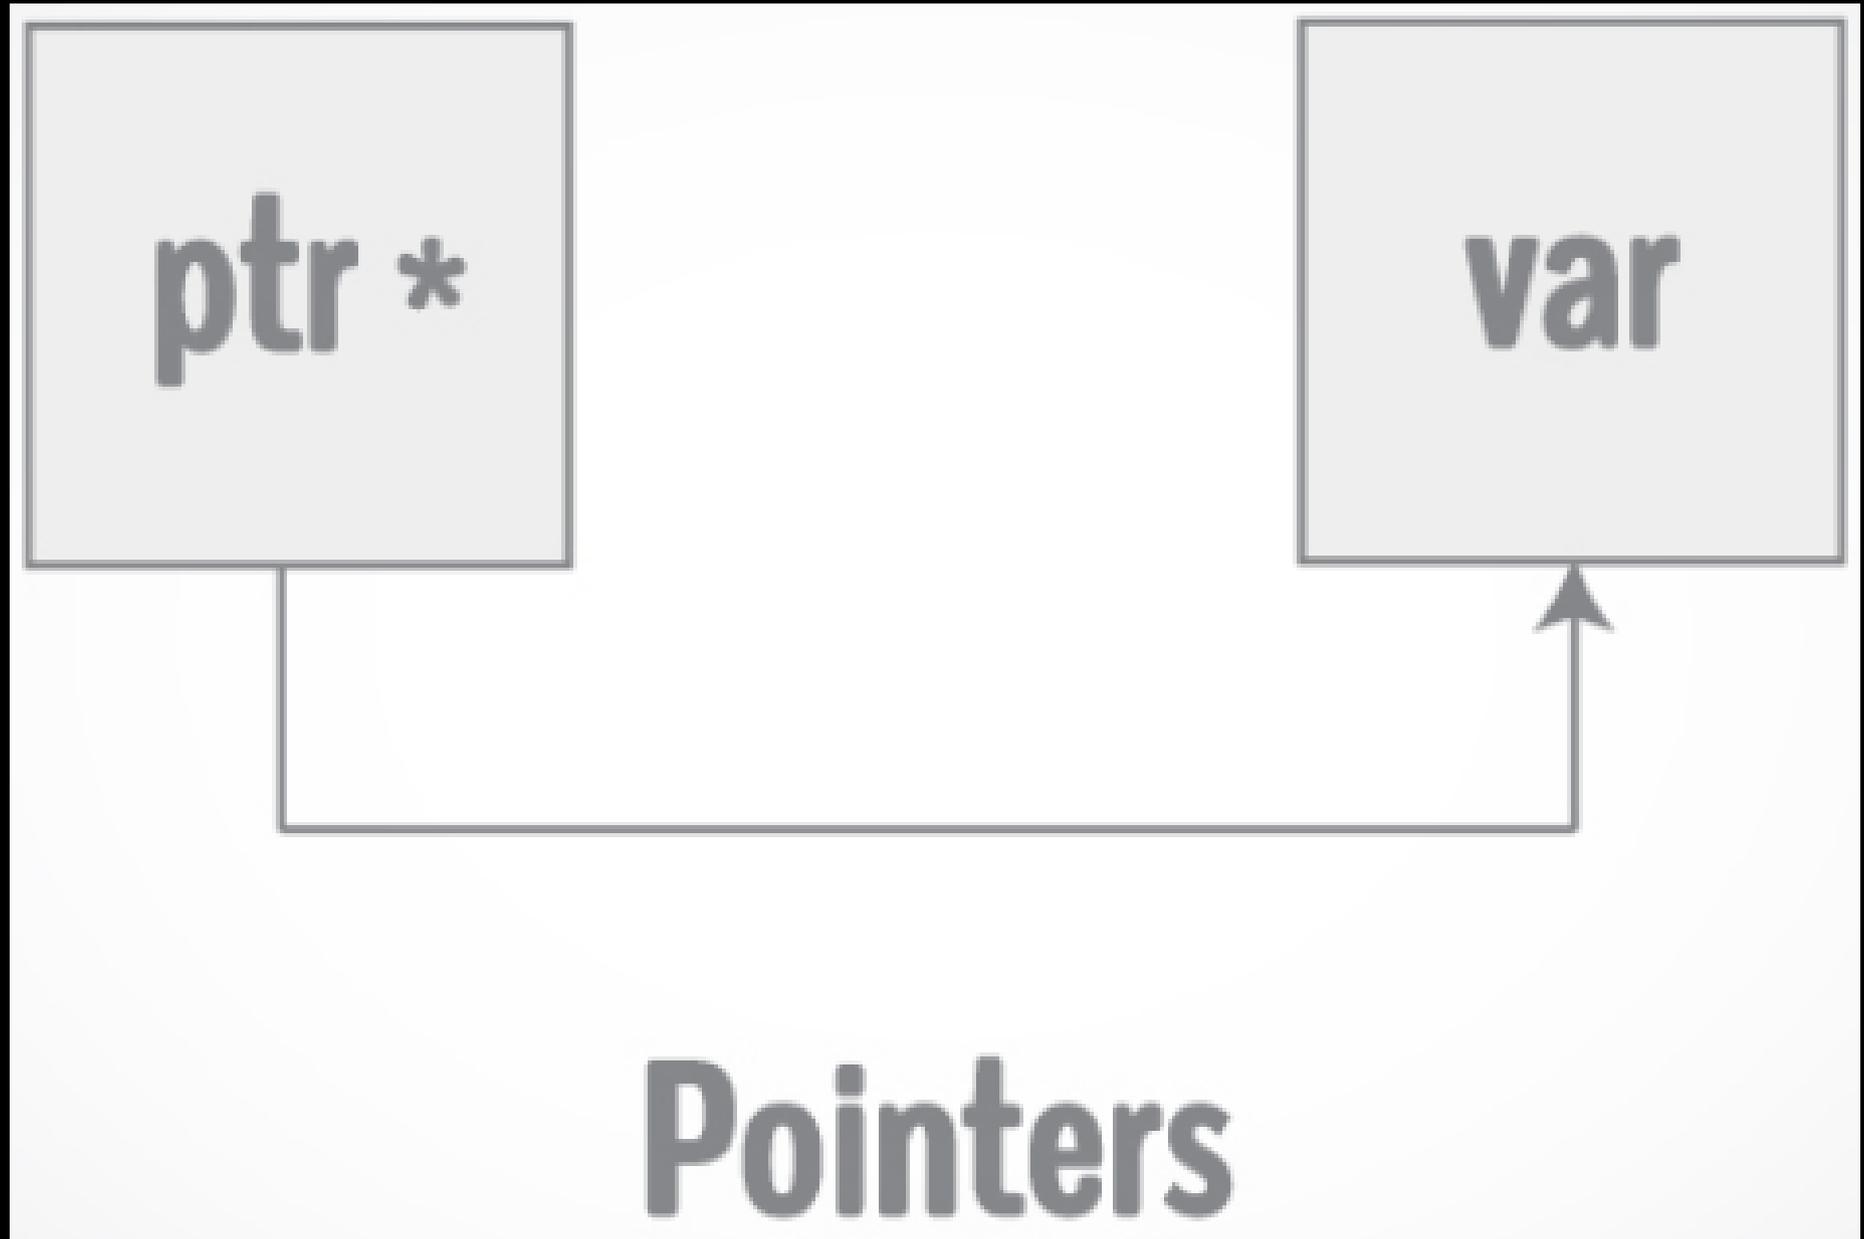

This is a copy of the information you need.

Or you could just look at page 241.

This is a pointer: the location of the information.

Pointers Point to Variables

Indirect & Direct Reference

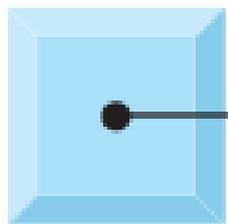

```
int *countPtr, count;
```

count

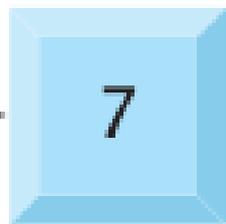

The name `count` *directly* references a variable that contains the value 7

countPtr

count

The pointer `countPtr` *indirectly* references a variable that contains the value 7

Declaring Pointers

```
int *countPtr;
```

```
// Did you notice the difference between  
// declaring a variable and a pointer?
```

```
// * says countPtr is a pointer
```

```
// int says countPtr is pointing to an
```

```
// integer variable
```

Pointers Point Huh!?

Address	Memory Content
0	
1	
2	
3	
4	
5	
6	
	• • •
2^{32}	

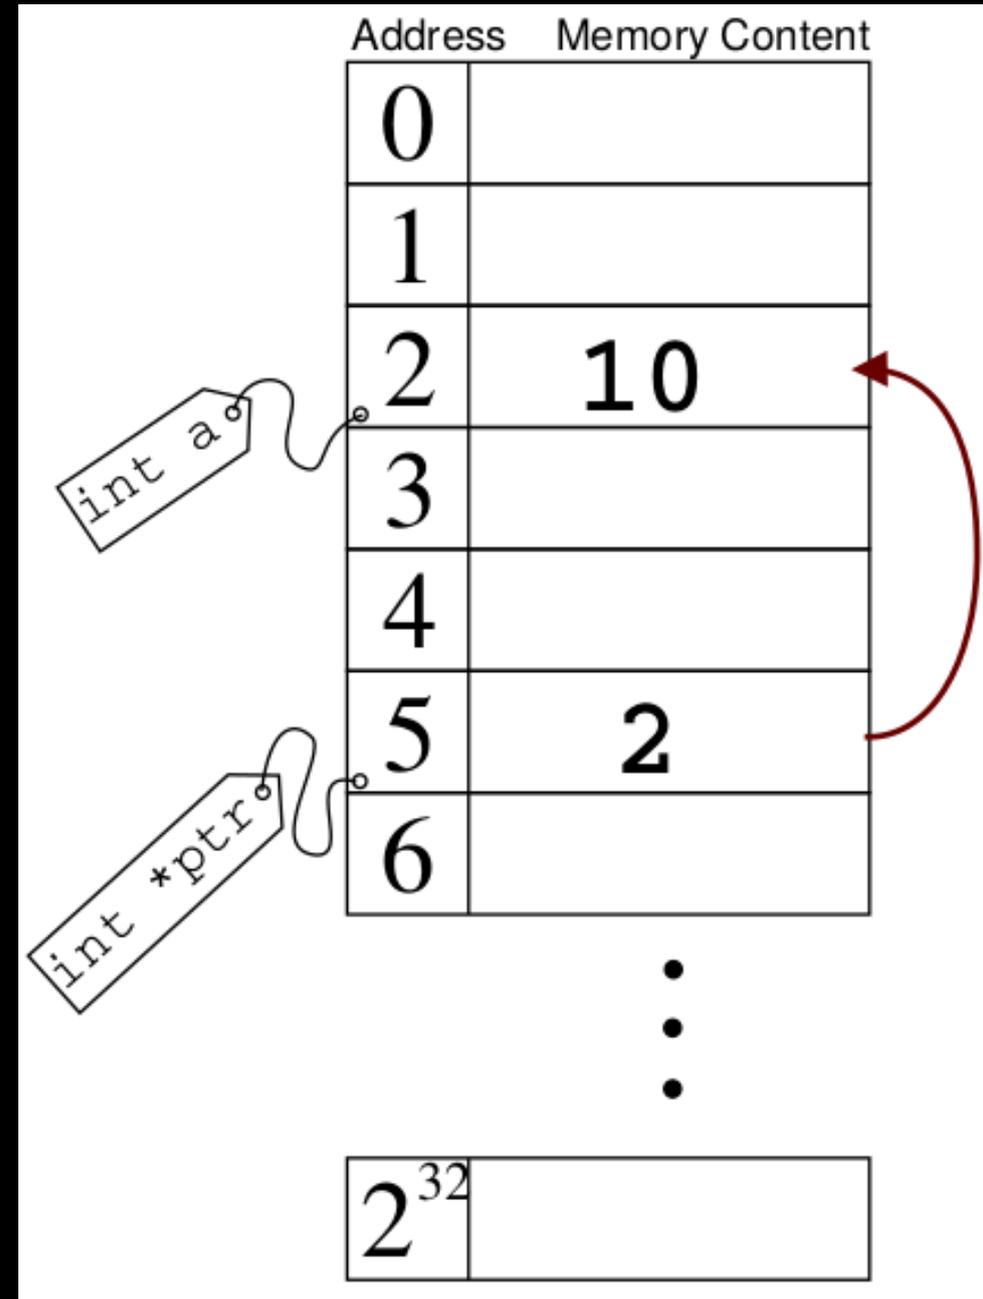

Memory organization in a system with a 32 bit addressing

Pointers Point Huh!?

```
int a = 10;
```

```
int *ptr;
```

```
ptr = &a;
```

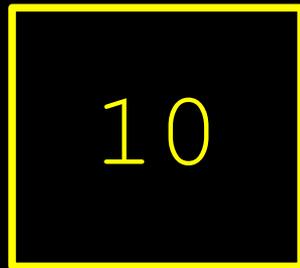

& and * Operators

```
int a = 10;
```

```
int *ptr;
```

```
ptr = &a;
```

a

00xBBA77

ptr

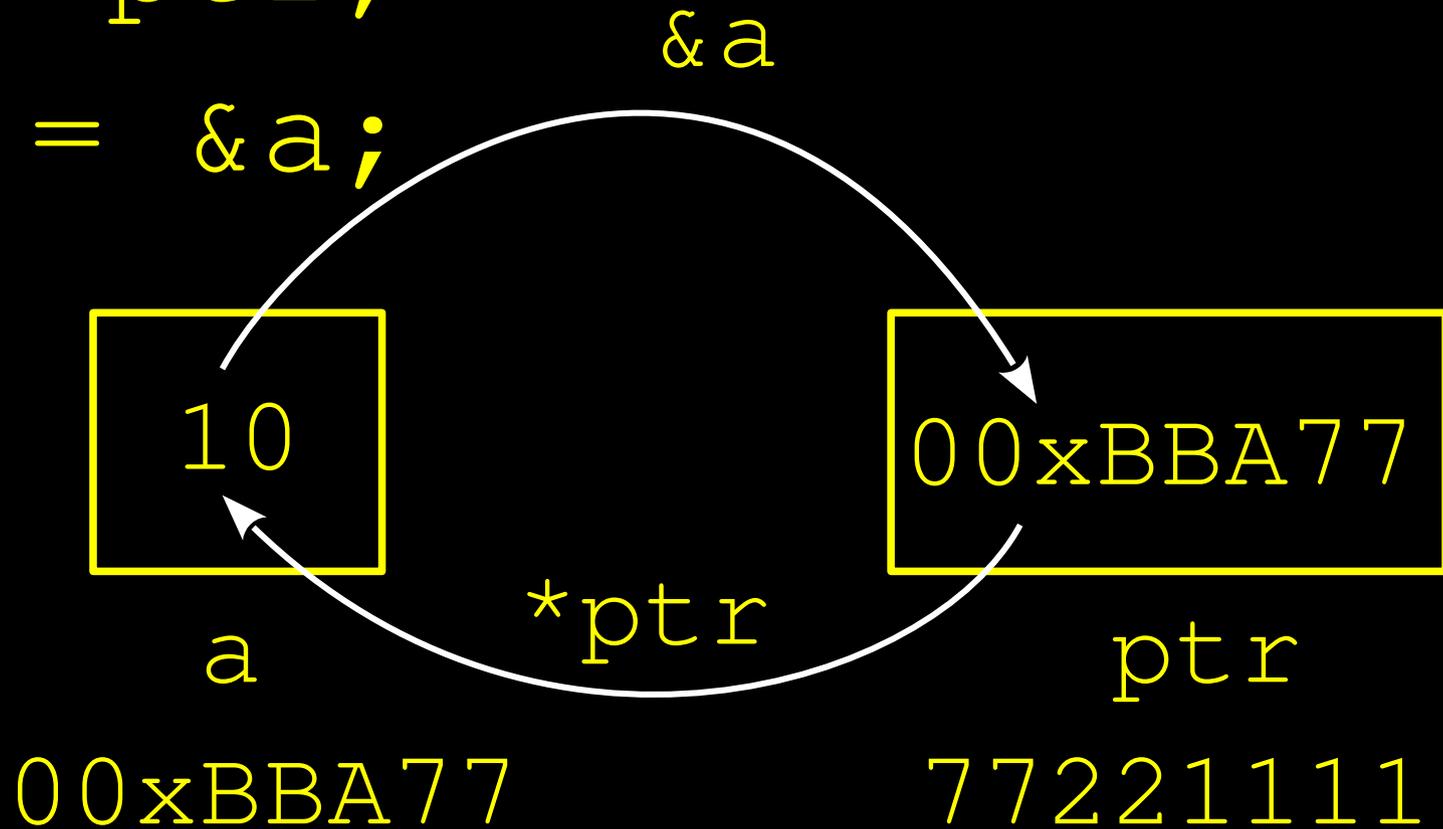

77221111

& and * Operators

```
int a = 10;
```

```
int *ptr;
```

```
ptr = &a;
```

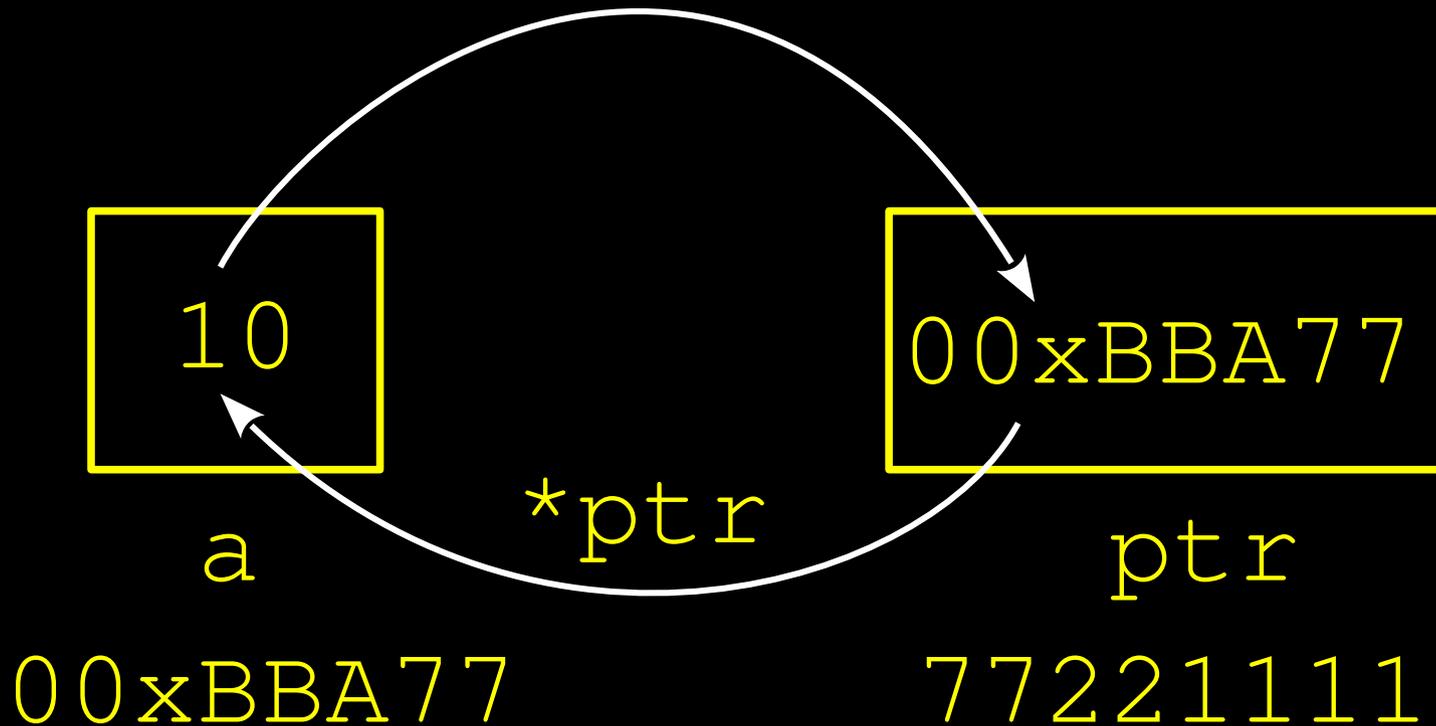

& and * Operators

```
int a = 10;
```

```
int *ptr;    What will be the effect
```

```
ptr = &a;    of *ptr = 3?
```

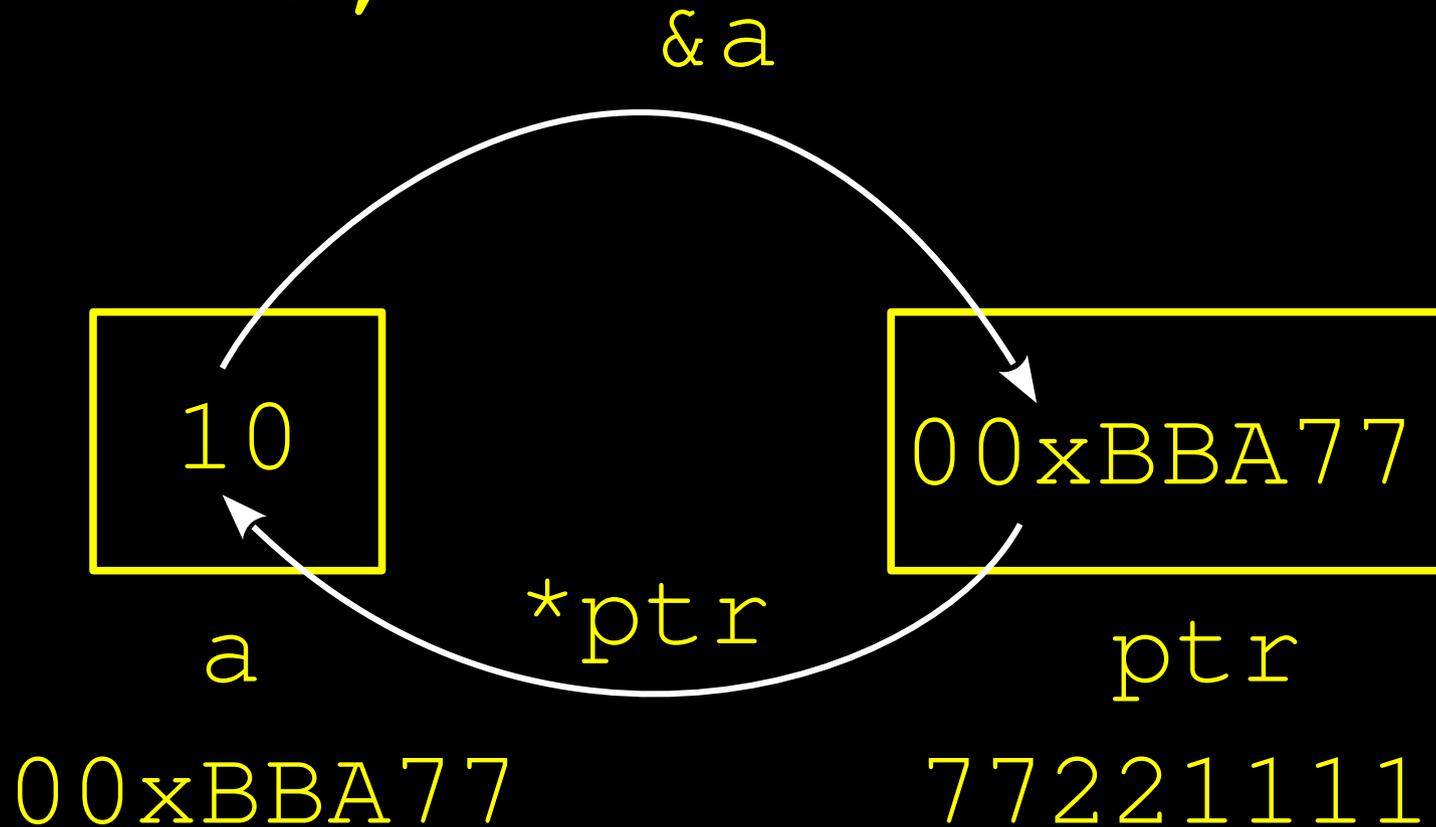

& and * Operators

```
int a = 10;
```

```
int *ptr;
```

```
ptr = &a;
```

The content of a
becomes 3!!

Indirect & Direct Reference

```
// 'a' simply refers to the memory  
// location allotted to a (direct ref.)
```

```
    a = 3;
```

```
    *ptr = 3;
```

```
// *ptr also refers to the memory  
// location allotted to a (in-direct ref.)
```

Remember

ptr

&a

means

*ptr

a

& and * Operators

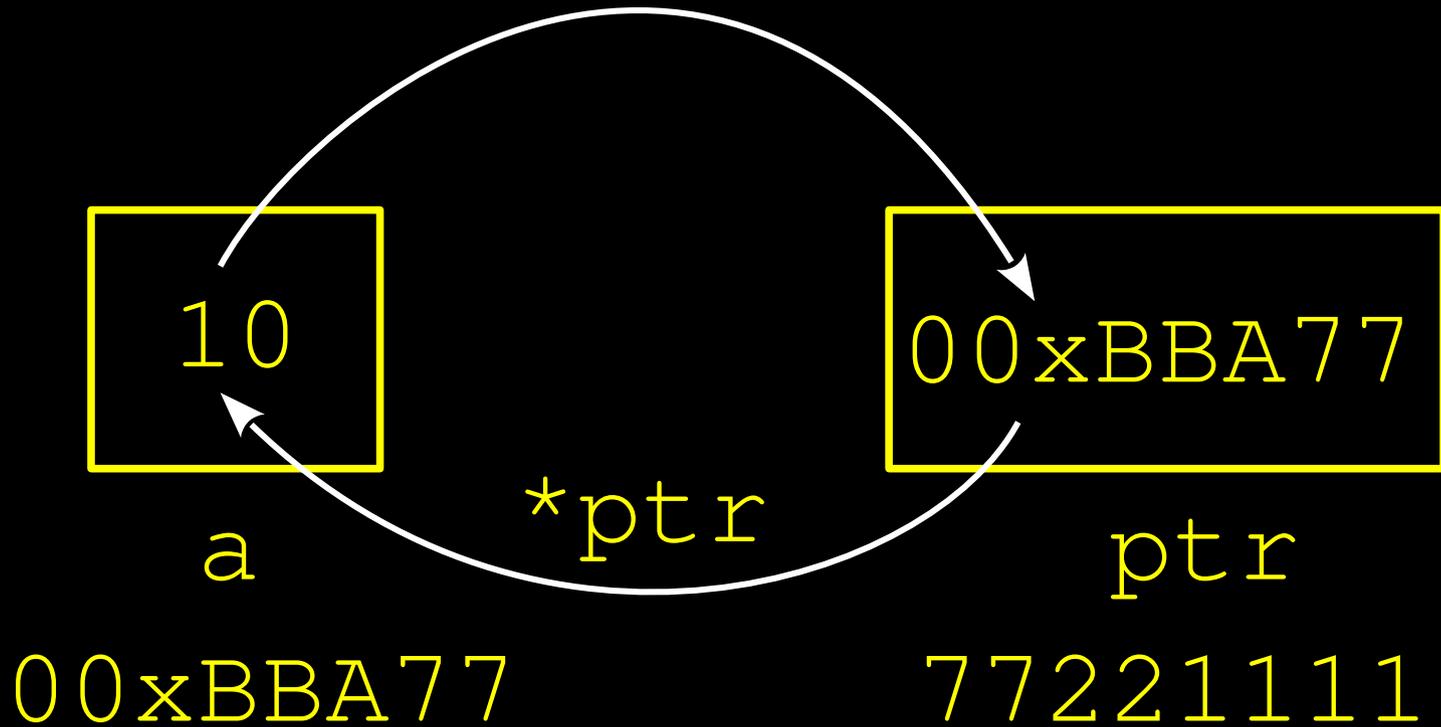

```
int a = 10;
```

```
int *ptr;
```

```
ptr = &a;
```

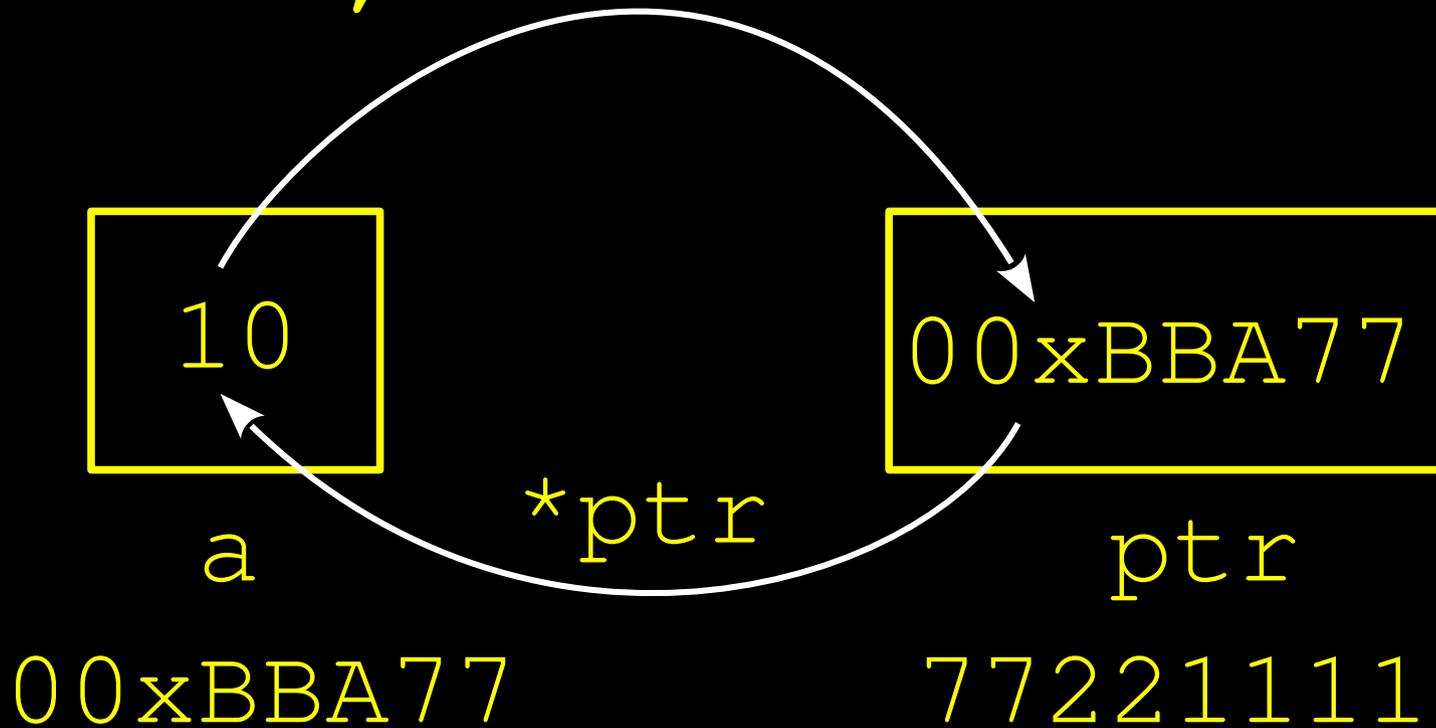

What will be the effect
of **&ptr**?

&a

& and * Operators

```
int a = 10;   The address of ptr  
int *ptr;    i.e. 77221111 is fetched.  
ptr = &a;    &a
```

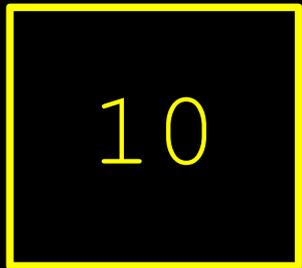

```
// ptr is variable too and has an address
```

Multiple Indirection

```
int a = 10;
```

```
int *ptr = &a; // Don't confuse
```

a

ptr

00xBBA77 77221111

Multiple Indirection

```
int a = 10;  
int *ptr = &a;  
int **ptr2ptr = &ptr;
```

10

a

00xBBA77

ptr

77221111

ptr2ptr

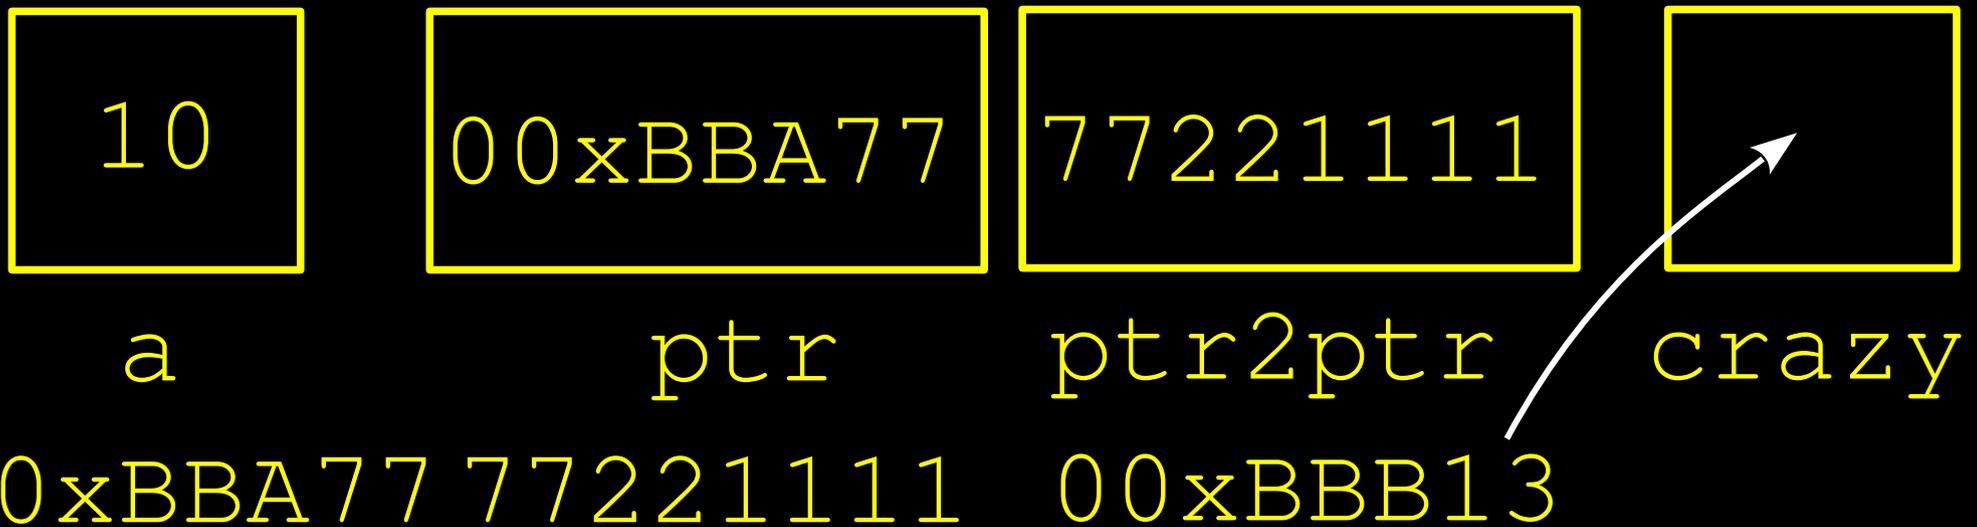

00xBBA77

77221111

00xBBB13

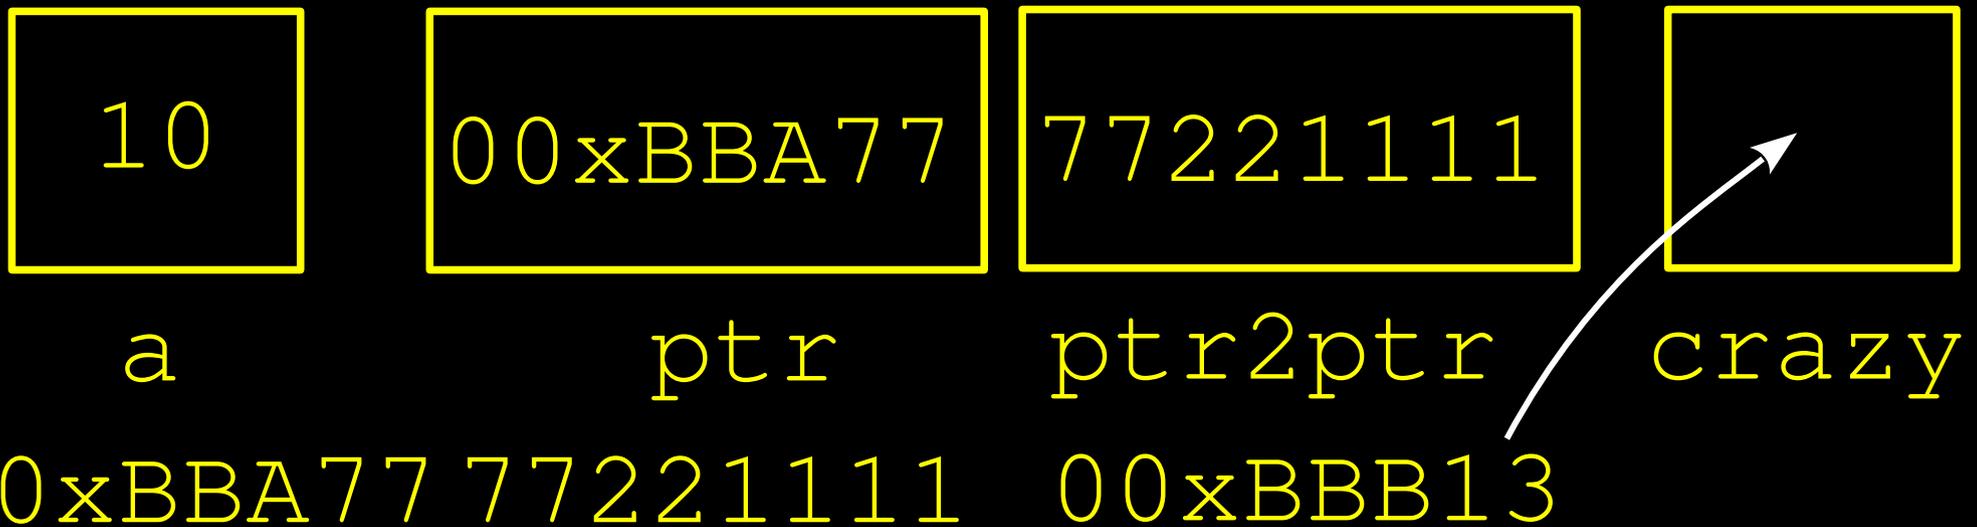

Multiple Indirection

```
int a = 10;  
int *ptr = &a;  
int **ptr2ptr = &ptr;  
int ***crazy = &ptr2ptr
```

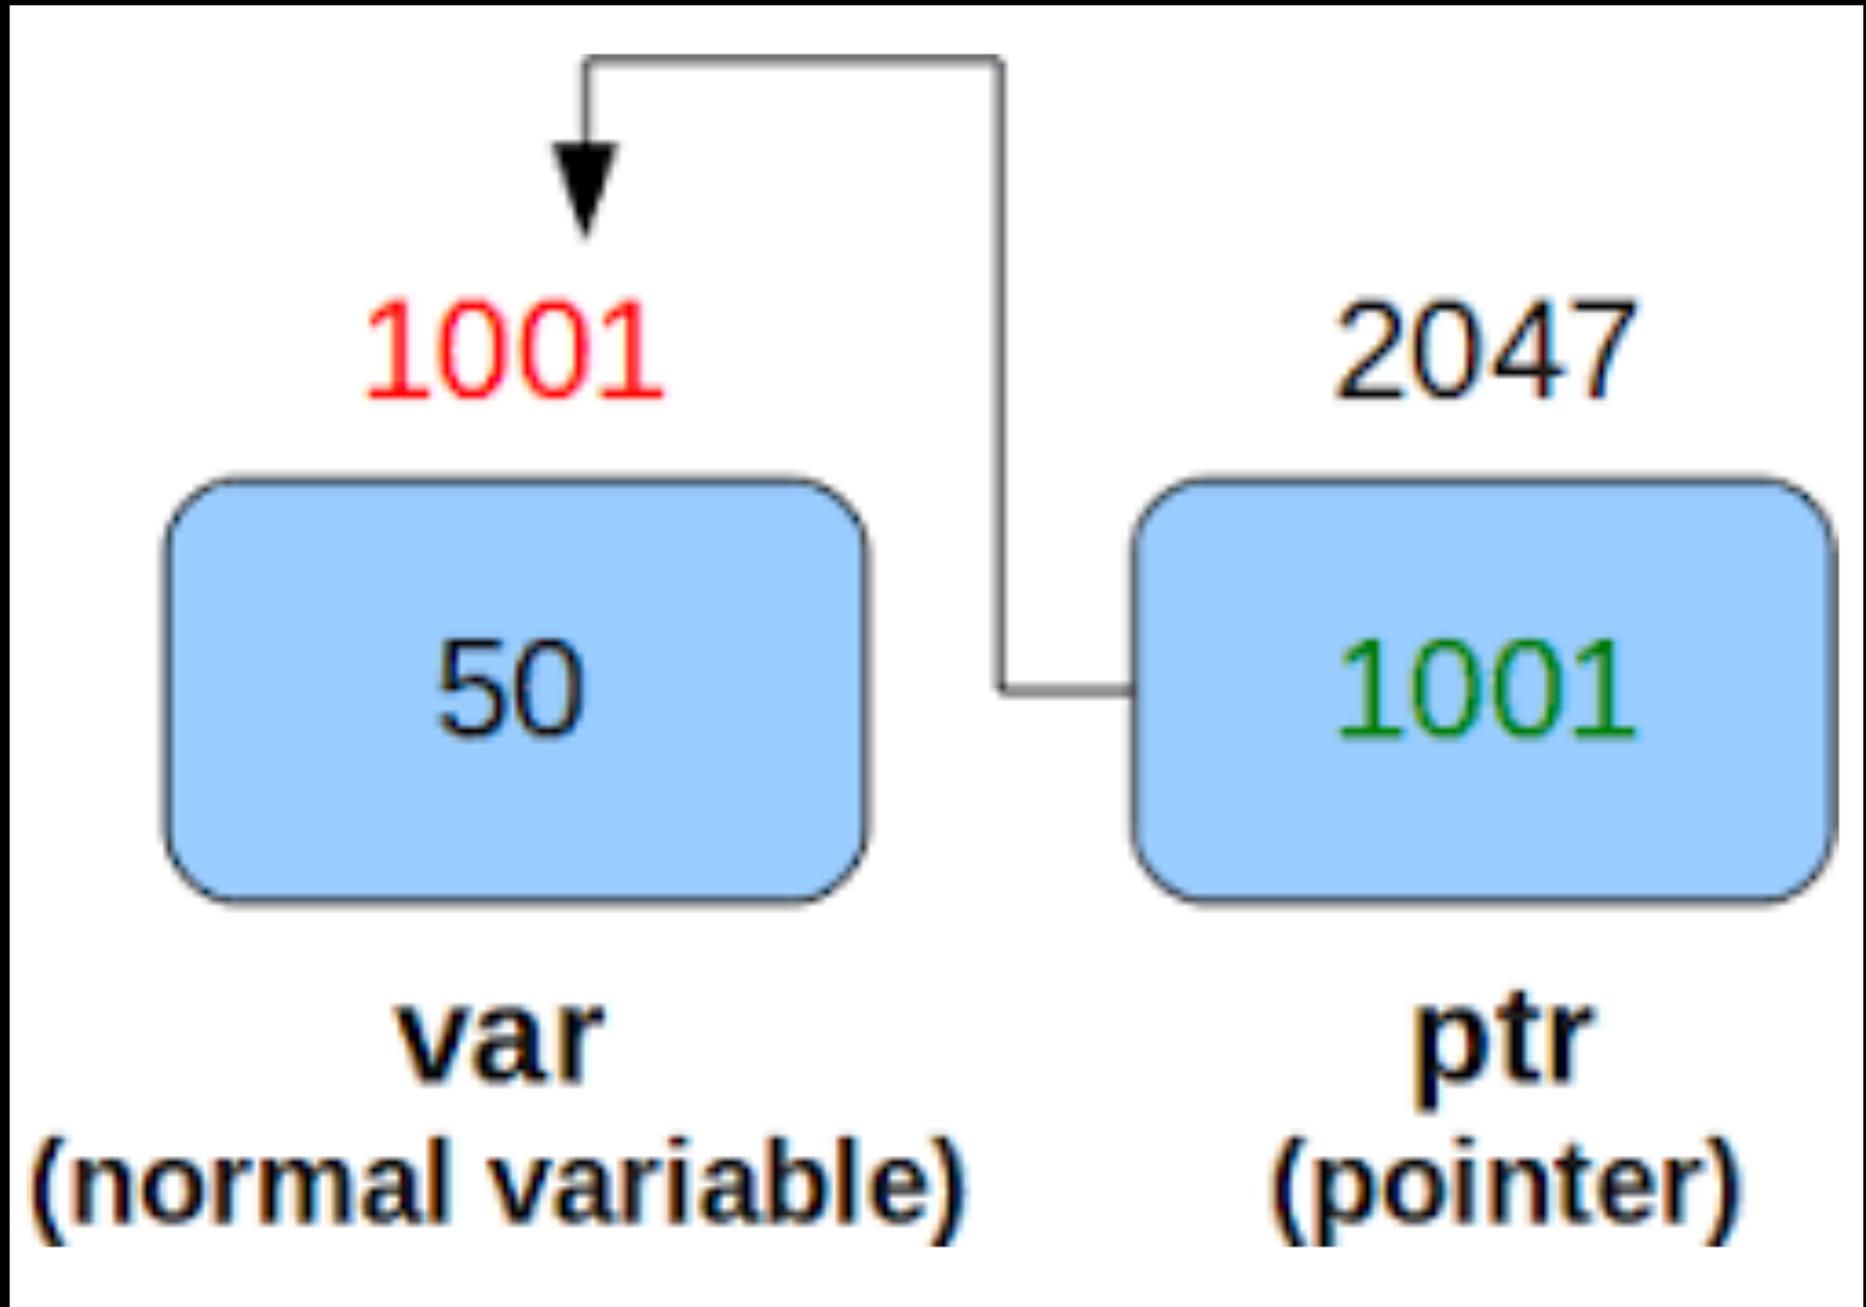

Multiple Indirection

```
int a = 10;  
int *ptr = &a;  
int **ptr2ptr = &ptr;  
int ***crazy = &ptr2ptr  
// Remember *crazy = ptr2ptr !!!!  
// like *ptr = a !!
```

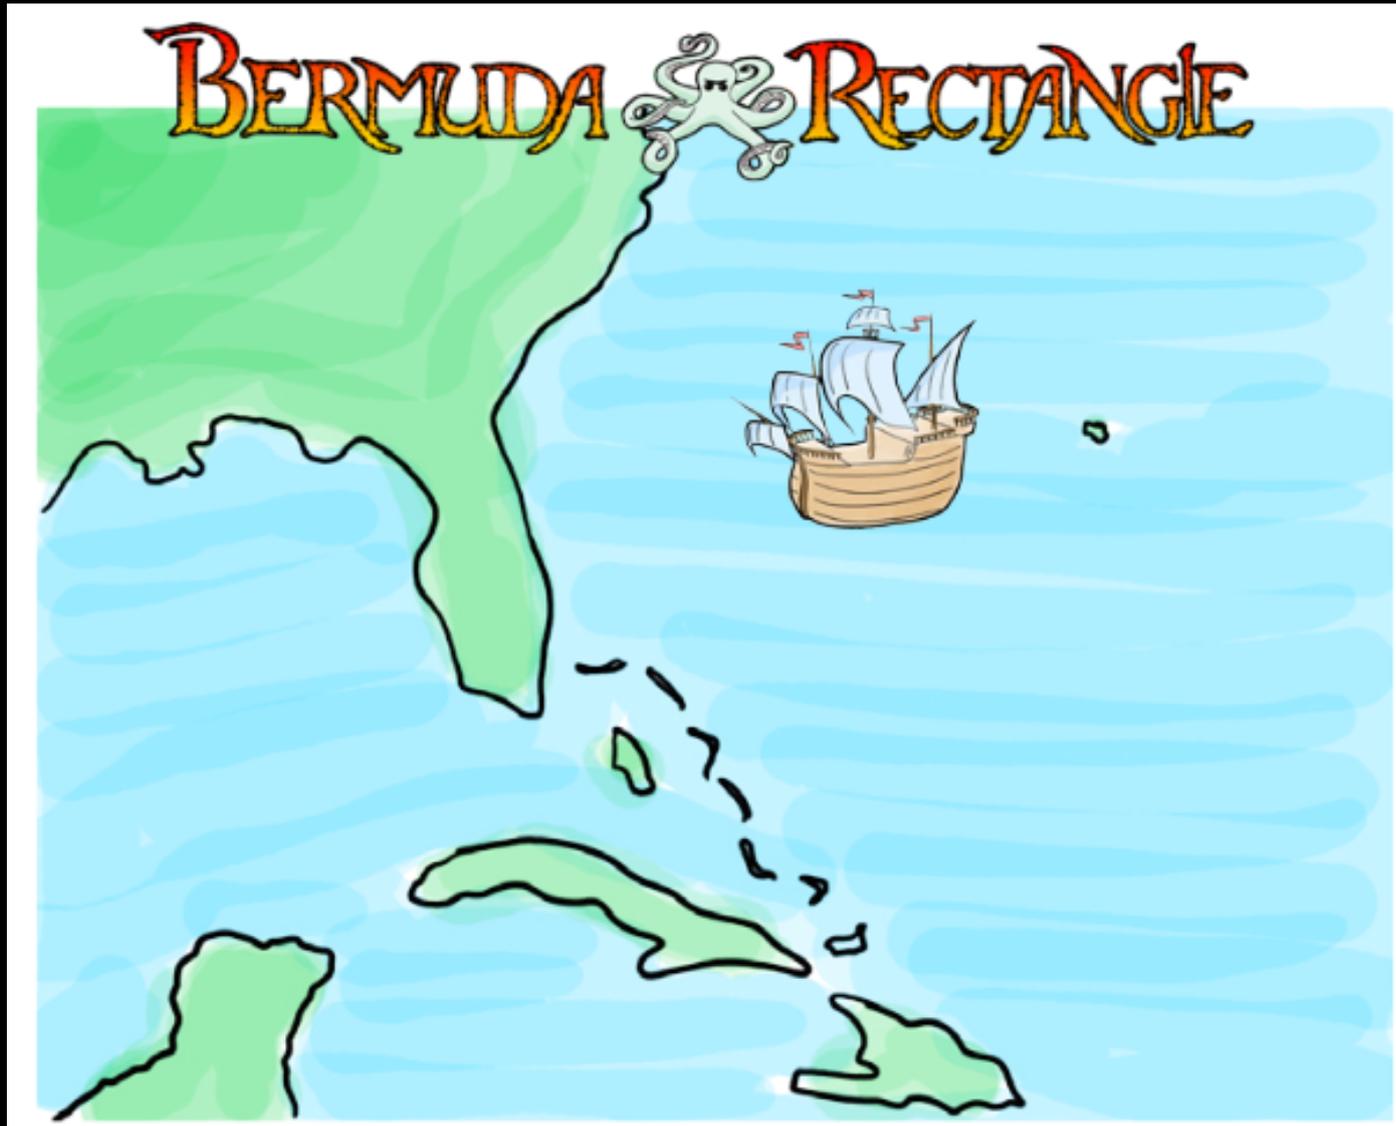

Pointers Point to Variables

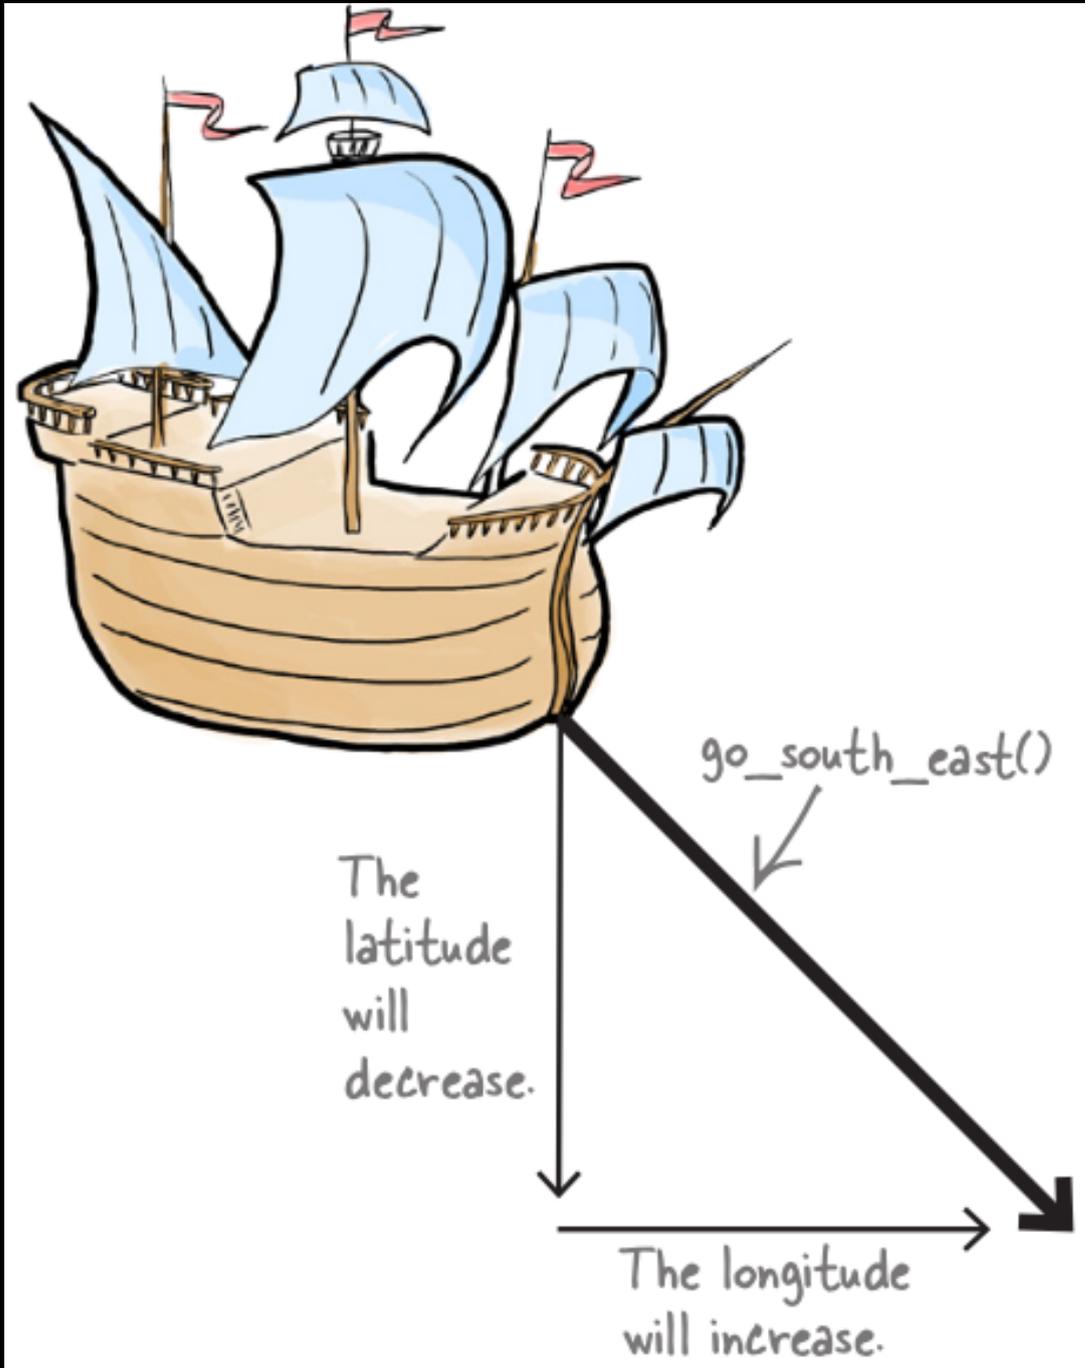

So What?

// Let's write a game for players to
// navigate around the

Did I Say Write a Game!?!?

Nay!!
Let's write a
function to set
sail in south east!

go_south_east

```
#include <stdio.h>
```

Pass in the latitude
and longitude.

```
void go_south_east(int lat, int lon)
```

```
{
```

```
    lat = lat - 1; ← Decrease the
```

latitude.

```
    lon = lon + 1;
```

```
}
```

↑
Increase the longitude.

```
int main()
```

```
{
```

```
    int latitude = 32;
```

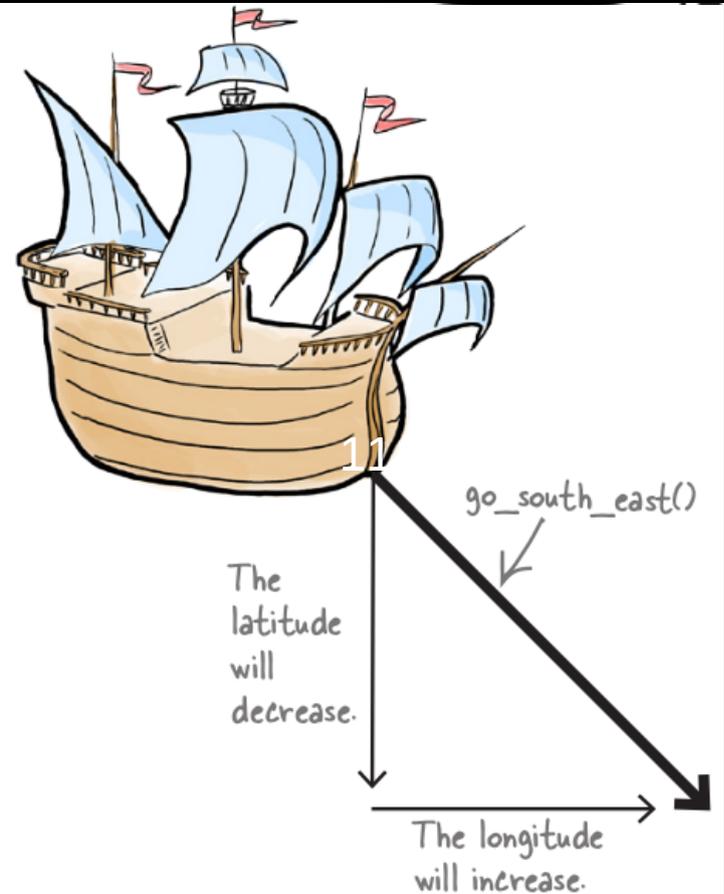

```
    int longitude = -64;
```

```
    go_south_east(latitude, longitude);
```

```
    printf("Avast! Now at: [%i, %i]\n", latitude, longitude);
```

```
    return 0;
```

```
}
```

Oops!!

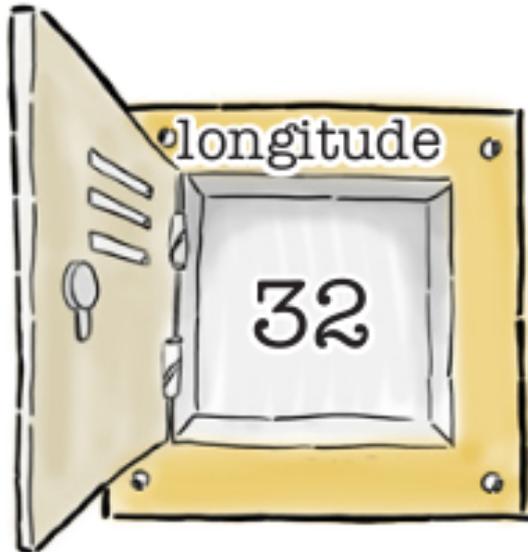

The code should move the ship southeast from $[32, -64]$ to the new location at $[31, -63]$. But if you compile and run the program, this happens:

```
File Edit Window Help Savvy?
```

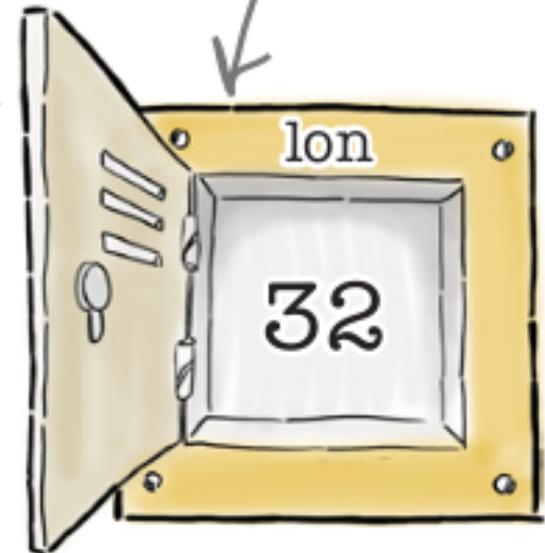

```
> gcc southeast.c -o southeast
> ./southeast
Avast! Now at: [32, -64]
>
```

What Went Wrong?

Remember call by value!!

This is a new variable containing a copy of the longitude value.

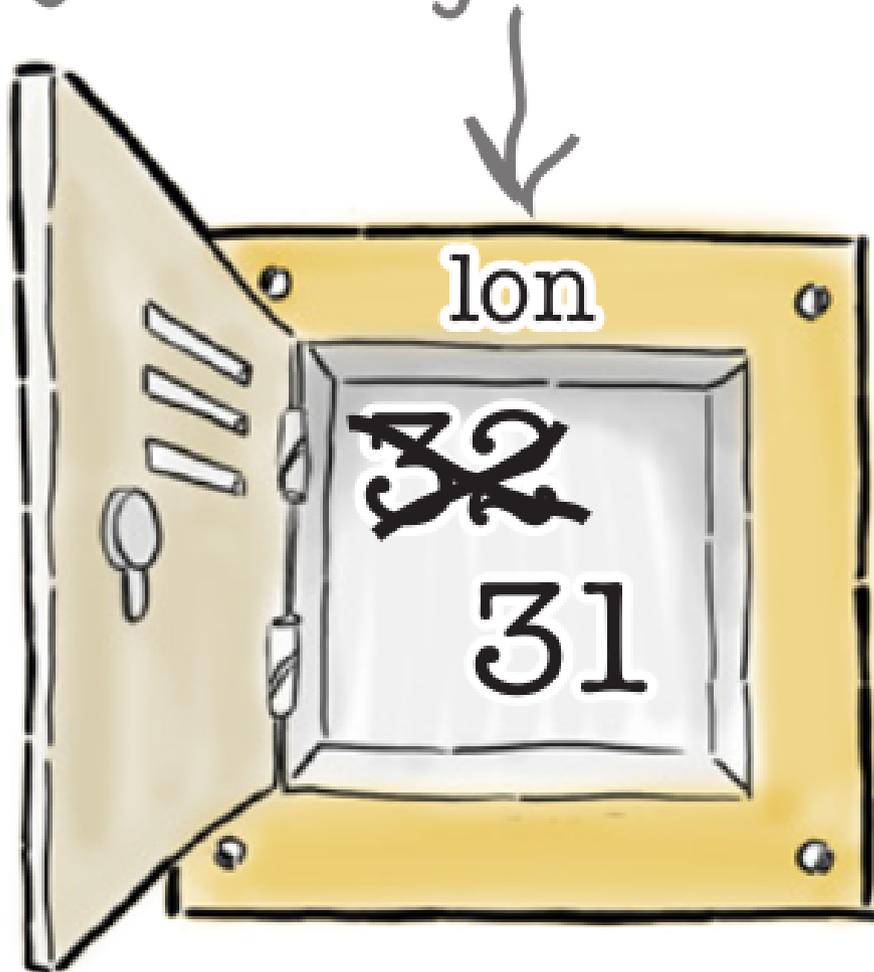

When you call a function you don't send the variable longitude to the function go_south_east() just its value 32 copied to lon

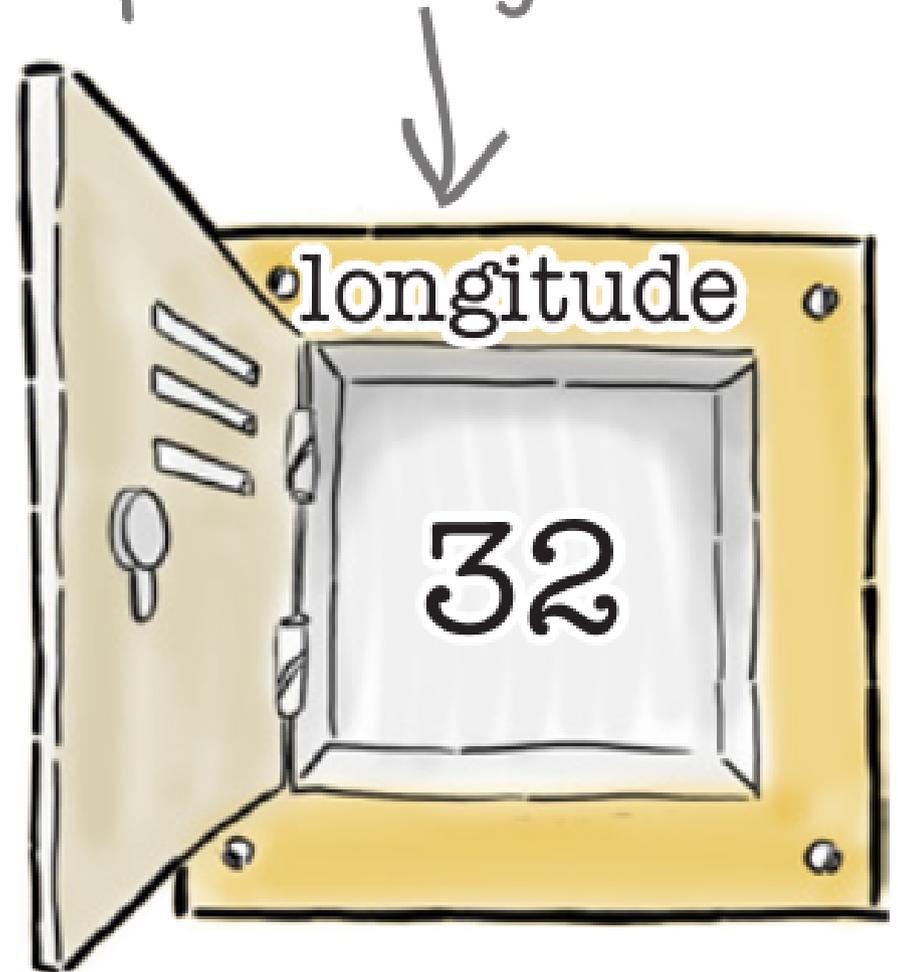

What Went Wrong?

Remember call by value!!

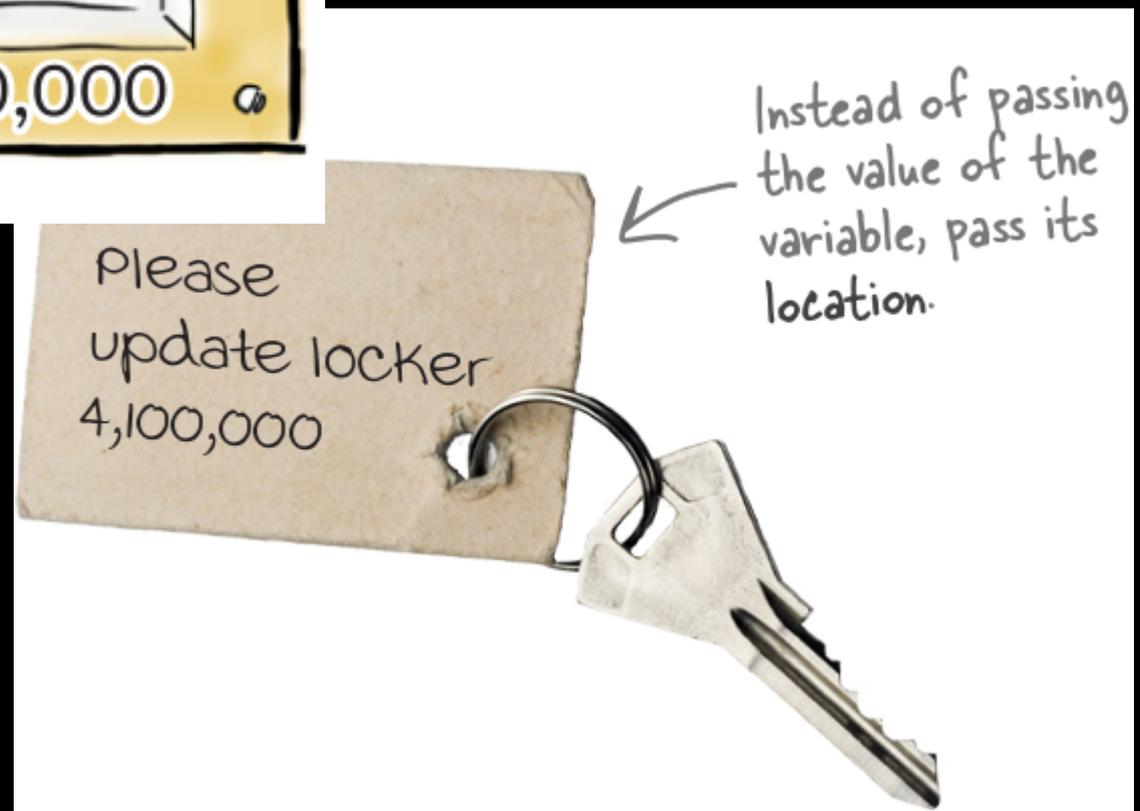

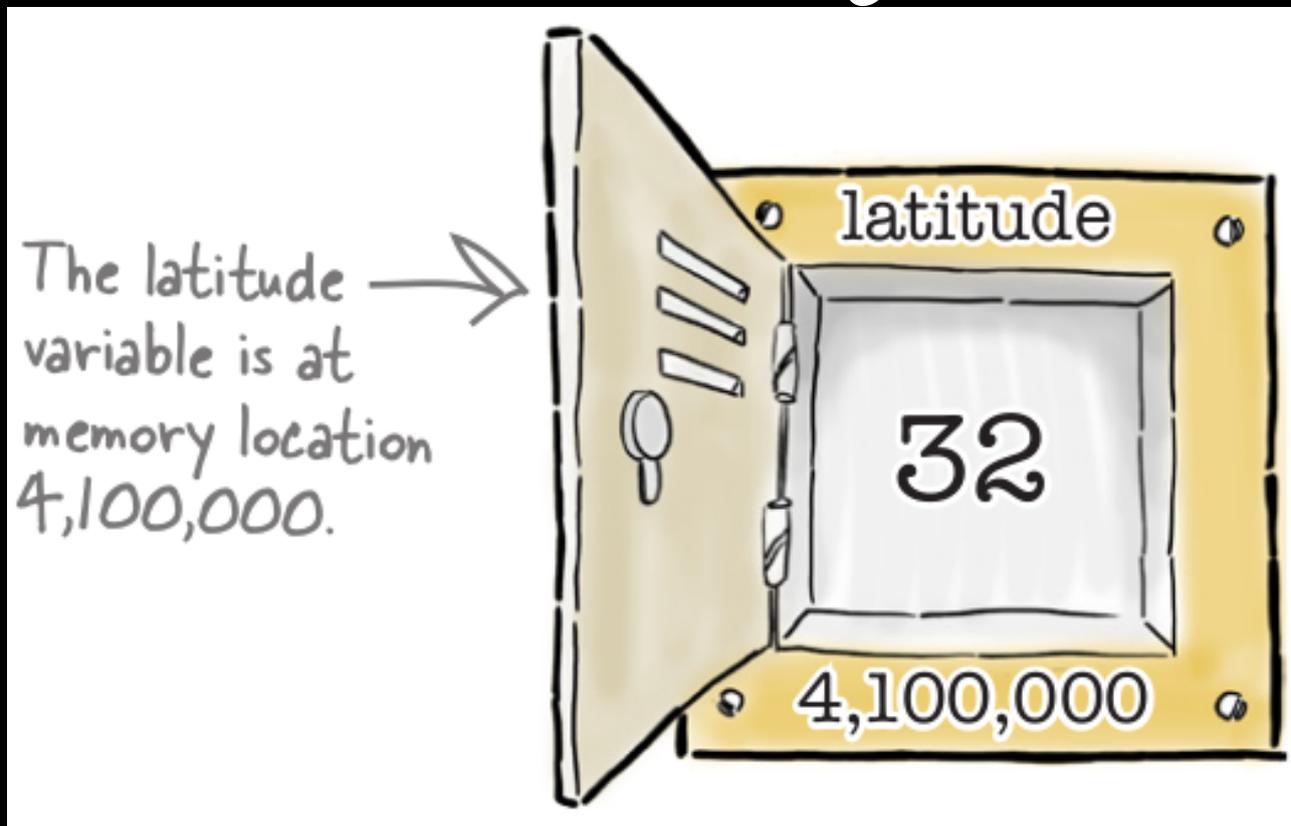

Only the local copy gets changed.

The original variable keeps its original value.

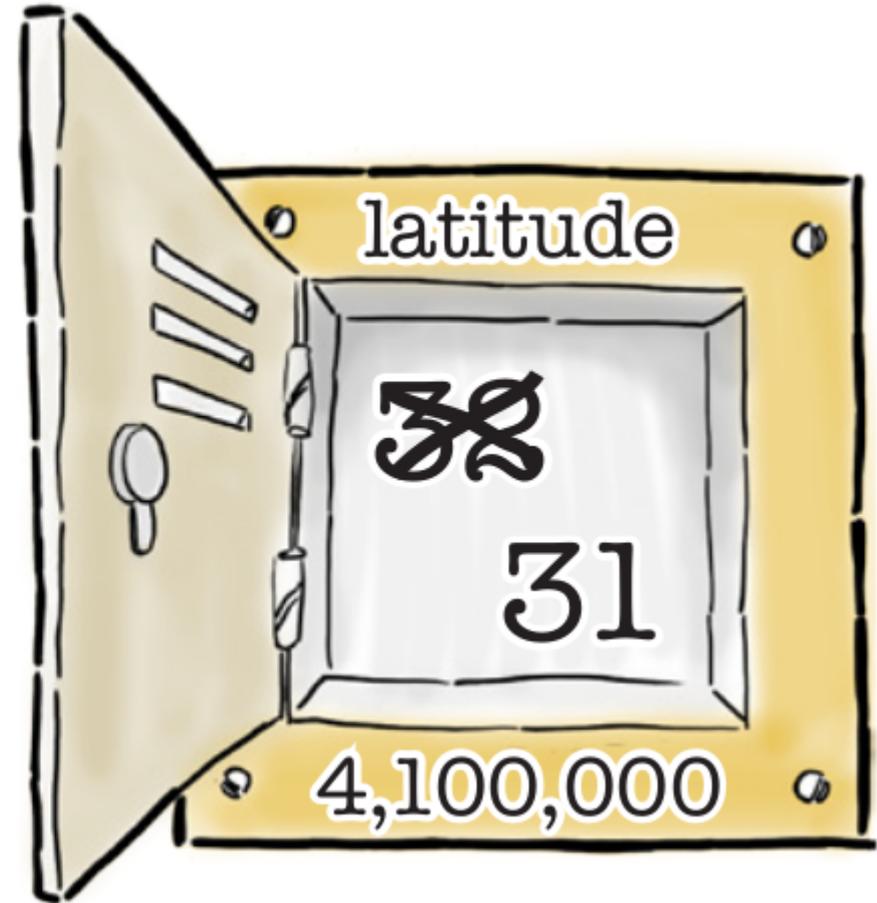

Call by Reference

Call by Reference

~~Read contents of
memory 4,100,000~~
~~Subtract 1 from
value~~
~~Store new value in
memory 4,100,000~~

Fixing go_south_east ()

// The parameters are of pointer type

```
void go_south_east(int *lat,  
                  int *lon) {
```

```
    *lat = *lat - 1;
```

```
    *lon = *lon - 1;
```

```
}
```

*lat & *lon are de-referencing and can access values of latitude and longitude in main, in other words *(&a) is a itself!!

Fixing main ()

```
int main() {  
    int latitude = 32;  
    int longitude = -64;  
    go_south_east(&latitude, &longitude);  
    printf("Avast! Now at: [%i %i]\n",  
          latitude, longitude);  
    return 0;  
}
```

File Edit Window Help Sawvy?

```
> gcc southeast.c -o southeast
```

```
> ./southeast
```

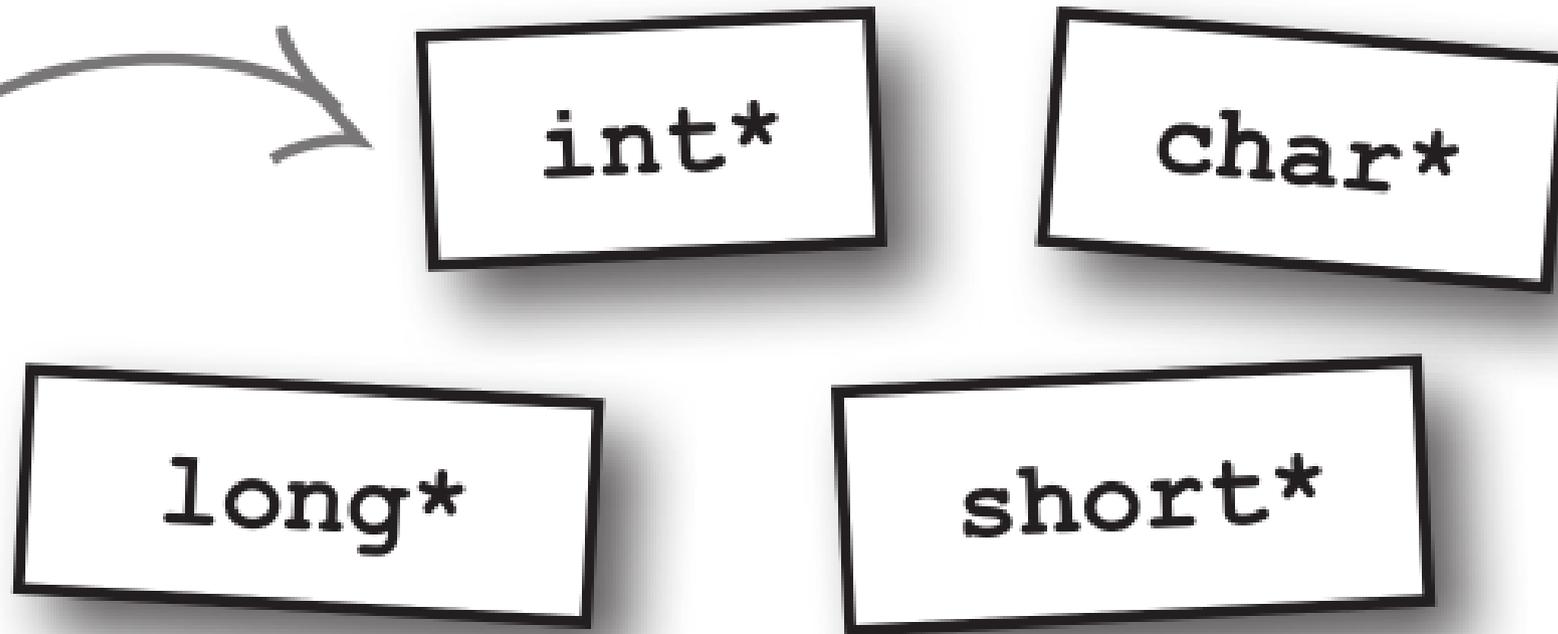

```
Avast! Now at: [31, -63]
```

```
>
```

Share Memory

Pointers let functions share memory – data created by one function can be modified by another function, so long as it knows where to find it in memory

Pointers have Types

Pointer variables have different types for each type of data.
